## COLLAPSABLE GOGGLES.

Dustproof, comfortable, light, ideal for  
motor cyclists. Price, per pair  
1/6. Sold elsewhere at 4/9.

## THE "V.M." PILLION SEAT.

With Footrest and Dressguard.  
Dressguard cut for tool bag or  
not, as desired.

Price, with backrest, 40/-  
Seat only - 20/-  
Seat with backrest - 26/-

## BULBS AND BULB CASES.

Metallic Filament  
Bulbs 4-volt for use  
with tail lamps, 1/-  
Polished Boxwood Case  
for spare bulb, 2d. The  
bulb is screwed into the  
base of the box and the  
cover is then screwed on, and  
enables the bulb to be safely  
carried in tool bag or pocket.

Description.—13" wide, 12" back to front,  
3 1/2" high. Upholstered dark green, suitable  
for practically all motor cycle carriers.  
Can be used on most carriers without removing  
tool bag by reversing stays that attach seat  
to carrier.

**A. W. GAMAGE, LTD., HOLBORN, LONDON, E.C.**

## WHY BUY FOREIGN DRY CELLS

When our British Made "Volex" are superior and at favourable prices?

### THE "VOLEX" EMERALD BATTERY. British Made.

Of particularly heavy capacity, recommended for Motor Car, Boat, or Engine Ignition; for lighting, actuating horn, etc. Recommended for export, and in conjunction with our "Volex" Special Metal Filament Bulbs about 150 to 200 hours' light is obtainable. Holds up in stock for years.

4 volts, size  $6\frac{1}{2} \times 7\frac{1}{2} \times 2\frac{1}{2}$  in.  
6 volts, size  $6\frac{1}{2} \times 5 \times 5$  in.

Price .. 10/6.  
Price .. 14/6.

### The "VOLEX" AERO DRY BATTERY. British Made.

A very convenient size for many purposes, such as Motor Cycles, Cycle Cars, etc. Suitable for ignition, lighting, electric horn operating. Holds up in stock for years.

4 volts, size  $6\frac{1}{2} \times 4\frac{1}{2} \times 2\frac{1}{2}$  in. Price .. 8/-  
6 volts, size  $6\frac{1}{2} \times 6 \times 2\frac{1}{2}$  in. Price .. 11/-

### The "Volex" Giant Dry Batteries.

For Motor Cycle & Sidecar Lighting and Ignition Starting they are excellent, and have no superior.

4 volts, size  $6\frac{1}{2} \times 3$  in. square, 6/6 each.  
6 volts, size  $6\frac{1}{2} \times 4 \times 3$  in. 8/6 each.

### THE "VOLEX" SPECIAL METAL FILAMENT BULB.

For use with our "Volex" Dry Batteries, ensuring maximum burning hours.

4 and 6 volts, min screw cap, 9d. each.  
4 and 6 volts, small B cap, 1/6 each.

### The "VOLEX" Dry Battery Motor Cycle Lighting Outfit.

Includes "Volex" Giant Dry Battery, Conducting Cord, Switch, and Penetra Motor Cycle Head Lamp or Sidecar Lamp with Bulbs.

Price  
32/6  
complete outfit.

Spare "Volex" Giant Battery, 6/6.  
Or complete with Rear Light, 42/6.  
Fitted with Sidecar Lamp in place of Head Lamp, 7/6 extra. Spare Battery for Combination Set, 8/6.

Bromley Cross, Bolton,  
15th February, 1916.

J. G. H.

Please send me one of your "Volex" Emerald Dry Batteries. The above is to replace one of the same bought May, 1914 (about 21 months ago), which has served ever since for working the Bosch Dual Ignition Coil of one of my cars, for starting. I am more than satisfied with the result, the cost being less than that of the mere charging of the pair of Accumulators.

# NEW HUDSON

## THE MASTER MODEL.

*"The Choice of the discriminating rider."*

The acknowledged superiority of the New Hudson Master Model (The Big Six) among discriminating riders created an insistent demand which compelled us in 1914 to erect additional large factories for the manufacture of Motor Engines, countershaft gears, and components.

To ensure the maintenance of the standard of high quality and superiority for which New Hudsons are justly famous, these factories were equipped with the most modern and accurate machine tools.

This plant has been very largely engaged on Government Contracts during the period of the war, but supplies now going forward will enable us to fill some of our earlier contracts. It may be that we can put you in touch with one of our agents who will secure early deliveries. Write us.

# MIDLAND

## MOTOR CYCLE TYRES.

### WHY IS IT

that you should insist on buying MIDLANDS when buying Motor Cycle Tyres?

Because "Midlands" are the last word in Motor Cycle Tyres. They are the result of years of investigation and practical experience. The product of manufacturers whose experts are not merely rubber and tyre experts but practical motor cyclists and that says a lot. Nevertheless the price is no more than you would pay for tyres of other makers.

#### THE MIDLAND RUBBER COMPANY, LTD.

Dublin Depot: 12, Gt. Brunswick Street.  
Cardiff Depot: Plymouth Street.  
Milan Depot: Via Sirtori 6.  
Amsterdam Depot: 50, Lange Leidsche Dwaars Straat

is the outcome of the fulness of expert engineering knowledge, technical capacity, and mechanical ability of its designer.

#### THE ENGINE.

The engine, for example, is best balanced, the lightest, the most powerful and reliable  $3\frac{1}{2}$  h.p. yet constructed. Engine features include positive oil pump, roller bearings, overhead exhaust valve, steel cylinders, Claudel-Hobson Automatic carburetter, etc.

#### THE SPECIFICATION.

The specification indicates the fine constructional excellence of the A.B.C. Motor Cycle. Leaf springing front and rear. Four-speed car type gear box with gate-change. Enclosed chain-drive. Two cush drives. Two waterproof internal expanding brakes. Easily removable rear wheel. Mechanical lubrication. Enclosed kick-starter. A.B.C. patent rigid handle-bars, and other exclusive constructional details.

## Model 91 —a big saddle

Seat Size,  
13½ x 13½ in.

—with  
a big repu-  
tation for  
comfort and ser-  
vice. It is specially  
designed and built  
for long distance riding  
and is the ideal saddle  
for heavyweight machines—  
either Solo or Sidecar.

This saddle incorporates the Empire-de-Luxe  
patent Double Hangers with Extension Springs,  
patent Shock Absorbing Link and Pressed Steel  
Anatomical Base—features which combine to eliminate  
all vibration and bouncing, even on the roughest roads.

The seat is well padded, the top being covered with highest  
quality leather—and the specially cranked steel girder frame  
gives ample clearance for exceptionally low and comfortable  
riding position.

Ask your Agent to show you this saddle—and write us for Catalogue.

**The LEATHERIES Ltd., Sampson Road North, Birmingham.**

# EMPIRE·DE·LUXE

# John Bull Tyres and Belts

If you have  
not yet fitted JOHN BULL  
TYRES AND BELT, it is  
simply because you don't know  
the extraordinary service of which  
they are capable—

Ascertain something about that service—  
**then** you will fit them both—

And, when you have done so, you'll be just  
as enthusiastic about them as we are.

See your Agent to-day—he'll tell you all  
about the Tyres with the proved average  
back-wheel mileage of 4,996 miles, and  
the belt with 15% to 33% extra  
driving surface.

**Leicester Rubber Co., Ltd.,  
LEICESTER.**

**Every  
Motor Cyclist**  
should draw upon  
this Storehouse  
of Motor Cycle  
Knowledge.

“Hints and Tips for Motor Cyclists” contains what may be termed the cream of all motor cycling knowledge up to date.

The book gives hundreds of useful “wrinkles” and little items of information concerning the running, management, and repairs of motor cycles, culled from the experience of many years of riding, and covering every detail of the machine.

The arrangement is simple and straightforward and reference is simplified by an extensive index and marginal subtitles on every page.

*Invaluable to  
the new rider*

The  
**Fifth  
Edition**

Revised, Enlarged, and  
brought up to date.

Contains over  
400 separate  
paragraphs.

No matter what type of  
machine is used, this little  
book will be found of the  
greatest service to every rider.

**Price:**  
**One Shilling net,**  
By post, 1/2.

London, E.C., and all  
Booksellers and Railway  
Bookstalls.

The  
**ROYAL ENFIELD**  
**Way Pays Best.**

Royal Enfields are doing good service in the business world to-day. Under ordinary conditions, with loads averaging from 2 cwt. to 3 cwt., there is no more advantageous way of delivering goods than by means of a Royal Enfield Sidecar Combination.

The all-chain driven Royal Enfield is specially suitable for this class of work. It is reliable to the highest degree, and its economy in petrol consumption and running costs is remarkable. Recent tests carried out with a Royal Enfield at Brooklands by "The Motor Cycle" gave an average of 76 miles to the gallon.

We can quote actual instances of where Royal Enfield Models are carrying goods of all descriptions—differing as widely as butcher's meat and builder's materials—and doing it day after day without trouble. We shall be pleased to send our catalogue, with full particulars of this model, on request. Mention "The Motor Cycle" when writing.

## THEY STAND FOR SAFETY AND SUPERIORITY.

Section of  
3 inch Non-  
Skid.

There is more than the advantage of security in Firestone Non-skid Tyres, in which superiority reaches the highest point of efficiency.

The present exacting conditions—the severe service of sidecars and the frequent over-loading—demand something more than an ordinary tyre.

Discriminating motor cyclists are turning to Firestone equipment, because it answers their demands for greater safety, more mileage, and more comfort.

## Firestone Non-skid Tyres

are built with Firestone accuracy for speed and endurance, and to meet every tyre requirement of the motor cycle.

Stocked in all Standard British Sizes and to fit Harley-Davidson, Indian, Excelsior, Thor, and all American standard machines.

Send for latest Illustrated Catalogue and Booklet, "Don't Take Risks, and Why!"

In answering these advertisements it is desirable to mention "The Motor Cycle."

Can you tell the difference  
between a  
1912 and 1913 P. & M. ?

Although you may have followed motor cycling closely for many years, the probability is that you could not.

The first P. & M., built in 1900, embodied certain new principles. The P. & M. of to-day embodies precisely the same cardinal features. The design was right from the start, and it is only in details that improvements have been possible.

You may have noticed on other machines that gears in a certain position, a particular type of transmission, or a particular form of starter, is boomed to such an extent that the unhappy purchaser is persuaded that that special feature will supersede all others. The following season the manufacturer will have discarded the design altogether, and the buyer realises the effect of this when he wants to sell his machine.

It is, therefore, easy to understand the high prices which obtain for second-hand P. & M. machines.

## OFFICIAL PRICES OF STANLEY BELT ACCESSORIES.

JULY  
6.

**THIS** week we interrupt our talks to emphasize the point, which does not appear to be fully understood in some cases, that the prices stated week by week in our advertisements are the prices at which you should be able to buy STANLEY goods. Do not pay more.

**The "STANLEY" FASTENER** as ordered by H.M. War Office. Used wherever motor cycles are used. The BEST at any price. Hardened and tempered hook and flanged pins. Never breaks. 9d.

**The "LION" FASTENER** Introduced to meet the demand for a CHEAP, RELIABLE BELT FASTENER. Guaranteed 5,000 miles. 6d.

**The "STANLEY" SPARE LINK** the best belt length adjuster yet invented. Saves time, trouble, any money. Saves the cost of a new belt: Fits any hook fastener. 1s.

Showing how the "Spare Link" is used.

**The "STANLEY" SHIELD** protects the belt fastener, prevents wear of the pulley, and conserves power. Specially designed for use with the Philipson Pulley. 8d

Showing how the "Shield" is used.

**Stanley Adjusting Links, 6d. for 3.**  
**Stanley Belting, 1/3 to 2/5 per ft.**  
(A Stanley Fastener given free with each Belt.)  
**10% increase on Belting only.**

Two interesting booklets sent on request.

## TYNESIDER CARRIER SEATS

FROM 5/6 UPWARDS.

DELIVERY FROM STOCK.

Send for new illustrated price list.

The new Tynesider Carrier Seat folds up as shown above. Can be used for either passenger or fragile goods. A compact emergency seat. It is an ideal seat for light or heavy weights, sidecar combinations, and improves the appearance of the outfit. Mounted on a special spring attachment, it is self-balancing, absorbs road shocks, and adds to safety of carrier riding, while the spring rods work in guides on the principle of a piston—thus preventing sideways. All adjustable, and will fit any carrier. Price, complete with reversible cushion, 16/6; without the backrest, 12/6. Seat, complete with clips but without springs or backrest, 5/6. Tynesider Bucket-shaped Pillion Seats, from 15/6 to 35/6. Children's, 14/6, with safety strap.

## THE LAST WORD in MOTOR CYCLE SEATS.

The essence of comfort is the Tynesider Bucket Seat. Low position, surpasses pan seats, beautifully sprung, no sideways.

Can be detached and used as a Pillion seat. Cost less than a saddle. 21/- complete, with adjustable clip to fit Indian or any other cycle.

Without springs, 15/6. Better quality, 27/6. Superior quality, 36/6 complete.

Ask your dealer to get one for you.

**HENDERSON'S SEAT WORKS,**  
UNION STREET, NORTH SHIELDS, Eng.

**Leo-sco**

**TUBE SAVER**

A RUBBER band which fits between the tube and the rim. It saves the tube from rust, bolt heads, nips, and prevents cover from creeping. Cost 3/9 each. Saves you time, money, and trouble. Ask your Agent about it or write us

**LEO SWAIN & CO.**

**237 DEANSCATE MANCHESTER**

## TRANSPARENT NUMBER PLATES.

(WOOD'S PATENT.)

A LONG FELT WANT SUPPLIED.

The law says that it is necessary to clearly show identification marks and registration numbers, otherwise you are liable to a fine.

The advantages of Wood's patent translucent Number Plates are as follows: They comply with the law, are always clear and legible, never require repainting, cannot possibly get out of order or broken as there is no glass in the construction. Are fitted with a Ruby rear sign. Sent ready for fitting, which can be done in a few seconds.

Price for use with own Electric Generator, Battery, or Accumulator, 10/6.

Price for use with rider's own lamps, 7/6.

Plates complete will be sent by return on receipt of registration numbers, accompanied with postal order.

**W. O. WOOD, Millgate, Market Place, STOCKPORT.**

Telephone: 262, Stockport.

## Sectional Motoring .. Maps ..

**C** Experience has shown that sectional maps are the most convenient for use on the road. The two maps described here have been prepared by Messrs. Bartholomew especially for the convenience of motorists. They are well printed, strongly mounted, and occupy very little space on the car. Military officers and other car users travelling in unfamiliar districts will find these maps of the greatest possible assistance.

Obtainable from leading booksellers and bookstalls,  
or from the publishers:

**ILIFFE & SONS LIMITED,**  
20, Tudor Street, London, E.C.

*The Autocar*

## Sectional Road Map of England and Wales

This consists of the well-known "AUTOCAR" Road Map of England and Wales, divided into 24 separate and loose sections, printed on stout cardboard, and with a key map on the back of each section. Scale 8 miles to the inch. Size of Case complete, 8in. x 9in.

Prices:	Net.	By Post
In Stout Waterproof Envelope	4/6	4/11
In Neat Cloth Case	6/-	6/5
In Solid Hide Case, with transparent front	12/6	12/11

*The Autocar*

## Sectional Road Map of South Eastern England

With special contour colouring. The area covered by this map embraces Luton on the North, Portsmouth on the South, Winchester on the West, and Broadstairs on the East. It consists of eight separate sections, on strong card, with index map on back of each section. Scale 4 miles to the inch. Heights are shown by contour colouring and distances between towns are plainly marked.

Prices:	Net.	By Post
In Stout Waterproof Envelope	3/6	3/11
In Neat Cloth Case	4/6	4/11
In Solid Hide Case, with transparent front	12/6	12/11

## Imports of Parts for Existing Machines.

THE prohibition of imports of motor vehicles and parts is placing manufacturers who use foreign-made engines or other parts in an awkward position. Cases have come to our notice where such firms ordered some time before the prohibition came into force certain important replacements from abroad, but the Department of Import Restrictions has refused to issue a licence for importations of the goods. In one instance, we know that there has even been difficulty over the importation of parts which were intended to replace stock which had been taken to fulfil urgent Army orders, but it is not likely that the objection in this case will be upheld. It seems, too, a somewhat harsh ruling that existing British-made machines having, say, foreign engines, must be laid up for want of some important detail owing to the refusal of the Department of Import Restrictions to grant a licence to import the goods. It goes almost without saying that users of motor cycles of foreign origin, whose agents may not have had the foresight or opportunity to lay in complete stocks, are likewise suffering whilst their machines lie out of commission. Of course, the obvious retort of patriotic people is that British goods should have been favoured, but then a man might reasonably reply that leading British firms have sold machines with engines minus a name, and it has not been clear to novices that the engine, or whatever it may be, hailed from abroad. We could quote numerous instances where manufacturers have studiously refrained from any suggestion that their machines were not entirely British made. In any case, from the foregoing remarks it would appear that the owners are to be made to suffer for having refrained from obtaining the fullest details of the origin of the machine they purchased. It may be that as time goes on the Department of Import Restrictions may not maintain such a severe

attitude and grant permission for the import of parts *intended for existing machines*, so as to cause a minimum of inconvenience to the assemblers of the machines and their clients. At any rate, that is our suggestion in order to minimise the inconvenience of manufacturers as well as users. The case is rendered all the more difficult, as engineering firms are too much occupied on munitions at present to make special replacement parts, and in any case this method is not a desirable one, for the making of special parts, singly or in small quantities, entails a waste of time and money out of all proportion to the results obtained, and the parts when produced are both more costly and less satisfactory than those supplied by the manufacturers of the engine, or gear or whatever may be the unit in question. We hope the matter will receive the attention it deserves.

## A Suggested Extension.

A precedent has been created by the proclamation gazetted last week, which announces that licences to import will be granted for replacement parts for vehicles intended for the conveyance of essential goods. The same proclamation permits the importation of spare parts for imported commercial vehicles which are already in the United Kingdom. It would prove a great convenience to owners of machines could licences be extended to the importation of parts for all existing motor vehicles, provided a suitable declaration is demanded.

We hope that this point will be duly considered by those in authority, for the matter is one of real importance to many. There has in the past been no inducement to riders, save individual patriotism, to purchase the British article, and all nations have been free to dump their produce upon our shores. It is, therefore, rather hard lines that those who have been encouraged by successive Governments to uphold free trade should be suddenly deprived of the use of their machines because Britain has at last awakened to her own interests.

## TRIALS DIFFICULTIES IN HOLLAND.

Our Dutch Friends hold another Motor Cycle Reliability Trial.

A DUTCH TRIAL—SCENES IN THE "THREE PROVINCES TOUR."

The control at Meppel. A Douglas rider suffers a puncture. There were many British machines in the trial.

A ticklish bit—negotiating the path through cornfields. "Coming through the rye."

**T**HOUGH Holland has remained neutral, the war has had a great effect owing to its geographical position in relation to the belligerent nations. Motoring and motor cycling, however, appear to be in a flourishing condition, and trials are held at intervals by the different clubs. These events have been referred to from time to time in *The Motor Cycle*, and we are now able to give some particulars of the most recent—the Three Provinces Tour of the Noord-Nederlandsche Motor Club.

Our Haarlem correspondent, describing this event, writes as follows: "Motor reporting is the most complicated form of journalism. In addition to the usual qualities, literary, artistic, poetic, which every reporter possesses, one ought also to be able to assist at small repairs between controls in record time, to be everywhere at the same time, to give a clear

account of what one sees (in this instance) of a 239 km. ride in seven classes, on fifteen different roads, with seven average speed limits. Your correspondent will advise the hiring of an aeroplane next time, offering his services as an observer!"

Of the seven classes three were for motor cycles, and there were thirty starters in the motor cycle classes. There was a separate route for each class, each route describing an irregular 8 through three provinces. The start was from Groningen at 7.30 a.m., and all classes finished in the early evening at Zuidlaren.

The motor bicycles covered 150 miles, the sidecars 135, and the cars 170. The routes took competitors through typical Dutch scenery, and one part of the course was through cornfields.

### 150 MILES TRIAL IN VICTORIA.

**F**ULL results are now to hand of the reliability trial held by the Victorian M.C.C. at Easter. The route was from Melbourne to Mortlake, and the event preceded the big 200 miles road race that we reported in our issue of June 22nd, page 590.

The weather was extremely bad, heavy rain falling most of the time. Bad climatic conditions are much more serious on an overseas trial than at home, owing to the unmade roads and their consequent rapid deterioration after rain.

Following are the complete results:

#### SOLOS UNDER 600 C.C.

1. { E. B. Murphy (2½ h.p. Douglas) } Tie
- { T. Purves (2½ h.p. Douglas) }
3. E. Holloway (¾ h.p. Rover)

#### SIDECARS UNDER 600 C.C.

1. A. J. Sutherland (¾ h.p. P. and M. sc.)
2. E. C. Roberts (4 h.p. Precision sc.)

#### SOLOS OVER 600 C.C.

1. H. Dickinson (7 h.p. Indian)
2. C. L. Ruck (7 h.p. Indian)

#### SIDECARS OVER 600 C.C.

1. J. Gunn (7 h.p. Indian sc.)
2. J. H. Rhodes (7 h.p. Indian sc.)

Gunn was the only man to lose no marks.

A Melbourne nurse, who is a keen motor cyclist, rode to Mortlake on her two-stroke lightweight, in order to be of assistance if necessary to any competitor hurt in the Victorian club's 200 miles race.

# NEATNESS IN LADIES' RIDING ATTIRE.

Latest Developments of the Striside Skirt.

THE developments of the past few years in the design of ladies' garments for motor cycling have been rapid. The symmetry and graceful appearance disclosed in the accompanying pictures would not have been dreamed of a few years ago. In one photograph we see a young lady garbed in a warm coat and skirt ready for a long spin on business. It is a serviceable hard-wearing garment, and the object for which it has been

The garment is the acme of simplicity, allows freedom of movement, and is suitable not only for use on a motor bicycle, but for the river and on the golf course. In one of these photographs the natural fall of the skirt (the Striside), the division of which is not noticeable, is clearly demonstrated. The mount is a single-gear Levis, though, naturally, for a lady's use the two-speed variety would be more suitable.

Now that the development of women's dress for motor cycling is receiving the attention it deserves, manufacturers should devote their attention to render-

Illustrating the suitability of the Striside skirt

for touring, visiting by motor cycle, or walking.

designed is at once apparent. In the last picture she is about to start on her daily errand of mercy. Note the apron tucked up ready to be let down for use in a moment as soon as the hospital is reached. It falls down over the divided skirt, the presence of which is not then detected.

ing their engines externally as clean as possible. Suitable clothing and well-guarded machines will greatly increase the number of lady motor cyclists. We are indebted to Mr. E. Harrison, 41, The Grove, Hammersmith, W., the seller of the Striside skirt, for these attractive pictures.

## A NEW COLONIAL MODEL NORTON.

MESSRS NORTON MOTORS, LTD., have in process of manufacture a new 4 h.p. model designed to suit Colonial requirements having a bore and stroke of 82 x 120 mm., 633 c.c. It is still in the experimental stage, and no machines can be supplied for some time to come, but it will appeal to our Overseas readers when it does appear.

Its chief features are increased clearance from the normal 4 1/4 in. to about 6 1/2 in.; this necessitates considerable alteration in the frame, most noticeable at the bottom bracket where the Sturmey-Archer three-speed gear box is carried, and at the head, which is of much greater depth than in the ordinary models.

The tank has been redesigned, but while it follows the usual Norton shape, the slope on the nose has

been reversed, and both the width and depth have been increased, giving greater petrol capacity (2 1/4 gallons). Mudguard clearance has been especially studied, and at all points so much space is provided between wheels and guards that it would seem impossible for them to become choked, no matter how bad the road conditions. The carrier has been enlarged and strengthened, and is of very substantial build. Engine details are practically as before. When certain other points have been decided upon, and the present conditions of labour, etc., which are causing delay, have been overcome, this model will be eagerly sought after by many motor cyclists Overseas, who know the splendid character and reliability of the Norton products.

### A Further Selection of Letters from Readers all over the World.

OUR June batch of letters from Overseas again brings us many letters from that enthusiastic motor cycling dominion, Australia. From many of the expressions scattered throughout these letters it is evident that new British machines, scarce at any time in the dominions, are now almost extinct. Many things lead to this state of affairs, the chief, of course, being that very few manufacturers are in a position to turn out machines at all, even for sale at home. We have heard of several instances where enterprising manufacturers have attempted to relieve this shortage and have succeeded in getting a few machines exported, but owing to the uncertainty of sea voyages at the present time quite a number of these mounts are now at the bottom of the ocean. This, of course, also does not help to increase the already small supplies. Many writers express regret that the American machines are getting such a hold in the Dominion, not only owing to the better facilities for obtaining spares, but also because the machines are in many cases more suitable for the road conditions. However, we feel sure there will be pleasant surprises for those Overseas riders who are patient and wait for the "after the war" British models. It is significant that of the four British motor cycles selected by the military authorities, and chosen specially owing to their proved road-worthy qualities when put to the most severe tests on English roads, three have had to be considerably modified to enable them to stand up satisfactorily when submitted to war zone conditions, and these conditions very closely resemble those encountered in the Colonies.

We select the following extracts from our Overseas mail:

#### A Novel Sidecar Wheel Stand.

Mr. H. SMITH, East London, South Africa: "I do not think underslung sidecar chassis are much good for this country, especially when off the main roads, as they are inclined to foul the tops of some of the humps. These roads are generally simply two deep cart ruts with a hump in between. When an underslung chassis is used this hump is quite useful for jacking the sidecar wheel up when a puncture has to be repaired, but has the drawback of stopping one's progress if the two wheels of the outfit get into the ruts at once. I have noticed that there is a great strain on the chassis, and some are very inclined to drop in the front."

#### Riding through Sand.

Mr. H. J. WRIGHT, Toowoomba, Queensland, Australia: "Am writing to thank you for so ably championing the cause of Colonials and those who have rough tracks and not roads to use their motors on. You ask in the issue of February 24th how we manage in sand. Well, I may say we class sand into two sorts—usually deep drift sand and that with intermittent lumps of rock, stumps, grass, and

so on. Most riders here, when coming to patches of loose drift sand that they know contain no stumps, etc., open up and rush it, putting as much weight on the front wheel as possible. The other sort—well, it generally means low gear and foot slogging. If you have not a low gear (fixed engine)—well, you usually hop off and run alongside as fast as you can; if you cannot run, it is 'push.' By heavens, if some of those British firms do not soon put on spring frames they are going to lose their business in these parts, and I am pleased to see that *The Motor Cycle* is taking this matter up so energetically. I myself have ridden a  $3\frac{1}{2}$  h.p. Triumph and a  $3\frac{1}{2}$  h.p. Precision (built in Melbourne). The Precision had Druid forks, Terry links, and large tyres, and was quite comfortable. Re spring forks, there is too much bounce and not enough shock absorbing. I have broken three front mudguards through the wheel continuously bumping back on to the head. Why does not some firm give us a fork with enclosed springs, similar to the Harley-Davidson and Rudge, and about 6in. play instead of 2in.?"

#### Popularity of British v. Foreign-made Mounts.

MR. DONALD FORREST, Te Aroka, New Zealand: "On reading your introduction to extracts from Overseas letters in January 6th number (which, by the way, is the current number here) I am tempted to answer your last paragraph.

"Yes, you see in these opinions the commencement of a waning of the popularity of British-made motor cycles in these countries, and it is only the patriotism of Colonials that is making the process as slow as it is. To take any good English machine and bump over these roads for thirty miles is often exquisite agony, yet the same road to an Indian rider seems quite all right. The longer spring frame, larger wheels, and 3in. tyres make all the difference between misery and comfort.

"As far as prices are concerned, I fancy that the American machine will soon command a higher price than the British

#### AN EGYPTIAN MOTOR CYCLING GROUP.

M. Bannounah sends us this photograph, taken in Cairo, of himself and his two nieces and nephews. The little girl on the left has since learnt to drive the Motosacoché, though she has some difficulty in reaching the controls

## Overseas Opinions.—

machine. To-day the Auckland agents are charging £95 for an Indian and Excelsior and £90 for many of the best-known British cycles.

"British manufacturers should foresee that if the Americans get a good hold of Australian markets it will take years and cost fortunes to oust them out again, whereas all that is required now to hold the market is a comfortable machine of good old British quality."

## British Quality Best.

"J.G.," Doll's Point, Sandringham, N.S.W.: "As a very satisfied subscriber to your paper for the last eight years, and having at heart the interests of Empire trade, I look with some apprehension on the growing American import of motor cycles. Reliable figures show how the Americans are cutting into the Australian market while Britain is unselfishly engaged in defending not only her own liberties but America's as well."

"I trust that English manufacturers will find means to bestir themselves, so that, in addition to filling the demand for munitions, they may spare attention to the urgent problem of retaining and extending their markets."

"It is particularly desirable that they should study Colonial requirements. What suits the Colonies will give superlative satisfaction at home; but what suits at home will very often be quite unsuitable out here. We want 7in. or 9in. under clearance, not merely for crank case but for everything—footrests, gear boxes, silencers, magneto platforms, front chain cases, kick starter, control wires—everything. The evidence I could give to support this would fill a long letter. We need larger wheels and tyres—at least 28in. x 3in. We need spring frames. We need American standards of service in spares, plus English standard in quality of goods, which America cannot pretend to approach."

## No Rain for Seven Months.

"A.M.O.," Broken Hill, Australia: "It may be of interest to your English readers to know that at present we are in this city paying 3s. 3d. per gallon for Shell and Plume benzine, and it is expected that the price will rise higher."

"The roads in this district are terrible, which is only to be expected, as we have not had rain for over seven months. We have also to pay very high prices for machines out here. Mine is a Blue Bell 3½ h.p. single, and cost £68 10s."

## Motor Cycle Useful to Farmer.

MR. A. T. STUART, Bredosdorp, South Africa: "You cannot imagine how useful a motor cycle is to a farmer. As you may know, we go in very largely for grain farming in this district. If one of the machines break, for instance, and an extra has to be obtained, much time is saved by going by motor cycle, when one can be back at work in a few hours, whereas if it is ordered by mail, a wait of two days and sometimes a week ensues."

## American Advertising in India.

MR. J. W. MURPHY, Sitarampur, Bengal: "I do not say that the American is not a good machine, but I do say that a British machine is better, and I have ridden both for years."

"The war, of course, may be the excuse of the British manufacturer for not letting us know here what he is selling, but before the war he was not doing his duty to the country in this respect. It is mostly English firms here who deal in motor cycles, and perhaps they get a bigger commission on American makes."

"There is very little solo riding done outside Calcutta, nearly every one going in for a sidecar. Even if they are single men they generally keep a sidecar attached and take a chum along. Again, the roads are not the ideal roads, and solo riding is accompanied with a certain amount of

danger, more so than at home. Your front or rear wheel may suddenly get into a sand pocket on the road, and unless you are an experienced motor cyclist you may come to grief. There are a hundred reasons which go against solo riding in India, but I have no time to jot them all down at once."

"I had no intention when I started this letter except to bemoan the lack of 'high explosives,' as shown by the dearth of advertisements respecting British motor bicycles. I do not know how my pen caught me napping and made me speak about solos and sidecars. I would like to see British motor bicycles advertised half as well here as, say, Beecham's Pills. It would pay the makers in the end."

## Australian Conditions.

"AUSTRALIAN," Annandale, Sydney, Australia: "Commenting on retail prices. My 4 h.p. Douglas outfit (without any extras), listed in England at £77, cost me £120."

"American machines are fast becoming more prominent—and why? They suit our conditions, and sell for a moderate price. English manufacturers must wake up to the fact that America is captivating the Australian market for the higher powered machines, and largely for the reasons given."

"I agree with other Oversea correspondents with regard to structural details. Our conditions require—(1.) Plenty of ground clearance. (A friend of mine, who rides an American machine, mounted my 4 h.p. English machine, and tried to turn at an angle, with the result that he broke one of my footboards and capsized with the machine.) (2.) Suitably sprung frame. (3.) Stronger rims and wider tyres. (4.) Wide mudguards without valances, and plenty of clearance between guard and tyre. (5.) Front fork attachments that will stand plenty of rough usage."

"No doubt the Great European 'Reliability Trial' will have as a result the production of machines that will suit Australian conditions. Let us hope so."

## A Lady Motor Cyclist in the Cape Province.

MISS L. HOPKINS, Cape Town, S.A.: "My mount is a lady's 2½ h.p. Douglas, on which I have travelled 8,000 miles in a period of two and a half years. My longest day's journey with passenger on carrier is 160 miles. It is a great pity there are not more spring frame machines. I think the general opinion out here is that the Douglas is the best lightweight, and, as regards sidecars, the Enfield and Indian run each other closely. There are about two dozen lady riders in this country. I consider I have been extremely lucky as regards breakdowns; not once have I had to train, and only twice have I pushed the machine, and then only a couple of hundred yards, owing to the chain breaking. I have travelled practically the whole of the above distance alone; in fact, the first 3,000 miles I rode the machine I had no one to accompany me. I have a fair amount of mechanical knowledge, and by careful study of 'Tracing Troubles' I had every confidence when I first ventured out on long journeys by myself. The motor cycle was so simple to learn that as soon as I got on the machine I was able to steer it, and after twenty minutes' tuition I rode home unaccompanied."

Men in the Services, either at home or abroad, may have "The Motor Cycle" sent to them regularly at the following rates, which include postage:

Home .. 6/6 per annum; 3/3 six months.  
Abroad .. 10/10, " 5/5, " "

Remittances, together with addresses in full, should be addressed to the Publishers, "The Motor Cycle," 20, Tudor Street, London, E.C.

Mr. J. Ferwerda, of the North Holland Motor Club. As many of our readers will remember, Mr. Ferwerda took a very prominent part in the Anglo-Dutch motor cycle *entente*. He is shown with his new Simplex, which is of Dutch manufacture. It is fitted with a twin-cylinder (64 mm. x 77 mm.) M.A.G. engine, combined chain and belt drive, kick starter, and three-speed gear. At a recent speed trial, held on a half-mile grass track, Mr. Ferwerda made fastest time in his class.

### The Consumption of Automatic Carburetters.

I recently remarked rather timidly that my own experiments pointed to the conclusion that automatic carburetters are extravagant in petrol. At the same time, my tests have been made with such a variety of engines that I rather threw out an enquiry than asserted a dogma; but a letter to hand from a trade reader confirms my speculation. He has recently tried out six different carburetters on a  $3\frac{1}{2}$  h.p. B.S.A. and sidecar, and the vaporisers which he employed were none of them genuinely automatic single-lever types, so that he has not tried the pattern which impressed me as remarkably thirsty. Nevertheless, his conclusions are as follow: Allowing for great pains and considerable skill in adjustment and fitting, the petrol consumptions registered with the sextet ranged from 55 m.p.g. to 80 m.p.g., and, without exception, the more sensitive the carburetter the greater the petrol economy. One of these two-lever vaporisers he describes as to all intents and purposes automatic in use, it being possible to keep the air lever wide open for practically the whole of the running; but his utmost efforts failed to procure a better record than 55 m.p.g. with it. At the opposite end of the scale he had no difficulty in securing 80 m.p.g. with the same load, the same road, the same conditions, when using the most sensitive carburetter of the six. This rather justifies the ancient sneer that an automatic carburetter is one which gives an imperfect mixture at all engine speeds.

### Two Corollaries.

On the other hand, the experiments outlined above are not conclusive against the automatic carburetter. They did not include a single car type carburetter; and many motor car vaporisers include, in addition to a multiplicity of jets and air intakes, an automatic petrol reserve, which enables the mixture to be kept thin during bursts at which engine speed is constant, by providing an emergency rush of petrol to enrich the mixture under sudden demands. These more complex designs may aid economy of fuel, though my personal belief is that they fail to do so. I have tried two such carburetters on motor cycle engines, and they both proved more extravagant of fuel than the semi-automatic motor cycle types, though they gave far better running. In the second place, my correspondent's tests did not include a multiple-jet type. The three-jet carburetter is at best only a compromise; it is an attempt to give perfect mixture at three arbitrarily selected engine speeds, *e.g.*, very slow, 20 m.p.h., and all out, coupled with a certain interaction and balancing of the various jets at intermediate engine speeds. The only three-jet which I have tried on motor cycle engines is the Binks, of which I am a great admirer; and I must except it from my accusations of extravagance. It requires care in tuning, but

when tuned up it usually improves the consumption no less than it extends the flexibility. Furthermore, the true multiple jets, like the Everest and the Wilkinson 12 jet, are stated by the few riders who know them to be very economical. I should therefore opine that the two-lever types are simple and admirable compromises, but are too simple to combine all the virtues; and that, if we want their virtues with real economy superadded, we shall have to advance into the region of multiple jets.

### Against Multiple Jets.

Whether such an advance is desirable remains an open question. Motor car engines provide no true parallel. The pilot jet of a 20 h.p. engine is huge compared with the pilot jet of a  $2\frac{1}{2}$  h.p., and is therefore less liable to choke. Again, the entire carburetter of a motor car is well sheltered under the bonnet, sucks in clean air, and is usually provided with a filter of generous dimensions. The motor cycle carburetter, on the other hand, is exposed to a great deal of dirt, and either has no filter at all or one of lilliputian size. Add to this an owner who may not understand anything about his machine, and so be incapable of the simplest diagnosis, and we cannot blame those designers who value simplicity above most other factors in a carburetter. Nevertheless, it is a fairly simple matter to conduct air to the carburetter through a pipe which will not admit dirt, and an even simpler affair to add a substantial and efficient filter. Therefore, if the multiple-jet carburetter ultimately proves to be the best, it can be standardised. In the meantime, there are certain carburetters so extravagant of petrol that I avoid them as I would the plague.

### The 1916 Douglas Engine.

I am one of the lucky few (outside Service men, *bien entendu*) who are running the latest  $2\frac{3}{4}$  h.p. Douglas, and it is extraordinary how each successive year brings an increase of power to this little engine. When I sampled its earliest model, I was frankly amazed at the plucky way in which it romped up long hills, and yet every spring since has added a new kick to it. The latest example is simply bursting with willingness, and rips away on top gear in astounding fashion; on a recent trip West, which included some fearful hills, I never found it necessary to drop below second gear. Moreover, the extra power is not attained by any sacrifice of flexibility, as sometimes happens. We all know what it is to rejoice on discovering that the 1916 edition of our pet  $3\frac{1}{2}$  h.p. can do 5 m.p.h. more than the 1915 edition; and presently to discover with a sigh that the slow running has been spoilt, or that the petrol consumption has gone up rather appreciably. But the new Douglas, possibly owing to carburetter improvements, is better at both ends of the scale; it can storm along in more masterful fashion than one expected; and eke it can tick like a sucking dove.

## Commercial Sidecarrier Reflections.

Much Already Done. More to be Accomplished.

### BUSINESS AND PLEASURE.

An 8 h.p. Coventry Excelsior owned by Edwin Bricknell, of Coventry. Mr. Bricknell uses it in his business of painter and decorator, and also for touring. It has proved an unqualified success, and since last August, when it was delivered, it has covered 4,000 miles. On the business box body 3 cwt. can be carried easily, and this load did not prevent the owner using his machine in the heavy snow of the early part of this year.

**I**N our last issue we produced a mass of evidence of the suitability of the motor cycle and sidecarrier for tradesmen's work, especially the rapid delivery of parcels. This applies with special force to those tradesmen, whether their shops may be in town or village, who have to deliver goods frequently to country customers. A sidecarrier can cover a given round in far less time than a horse and van; therefore deliveries can be made more frequently, with greater convenience to the customers, and more profit to the retailer. Evidence is reaching us almost daily of the increased popularity of the commercial sidecarrier, and we hear of it being used in what would seem the most unlikely trades. For instance, we illustrate herewith the outfit used by a paperhanger and decorator, which is shown carrying a ladder and steps, in addition to other trade requisites.

### Easy to Drive.

Every tradesman who adopts the sidecarrier should make a point of keeping careful accounts of all expenses; not only of running costs, but insurance, licences, and other incidental expenses. He will then have certain evidence that the sidecarrier is far cheaper to run and maintain than a horsed van. Another point is that a woman or girl, to whom it would be unsafe to entrust a restive horse, can drive a sidecarrier after a little practice, and drive it well. To obtain the best results the machines should be fully employed, but not overloaded, and kept in really good running order. With this object in view, a periodical overhauling is advisable. The most serious rival to the sidecarrier is a machine of the Auto-Carrier type of tricar. This

is not so speedy, but for some uses may be considered preferable in view of the fact that its load capacity is about double that of the average sidecarrier.

Doubtless in the near future manufacturers will devote much more attention to the sidecarrier; development will then be rapid, and we shall have vehicles eminently suitable for every trade.

An advantage of the sidecarrier that is often overlooked is that it is in itself a means of increasing a business. There are two reasons for this, the principal and most obvious being that by its adoption a business man's area of activity can be increased and more work done in a given time. Secondly, a smart motor vehicle with an attractive box body suitably lettered is a travelling advertisement in itself. It attracts attention, and so indirectly assists in bringing more customers to the owner's counter.

A typical British-built sidecarrier—the 6 h.p. Royal Enfield with delivery van body for 2-3 cwt. loads.

# RECREATION for WAR WORKERS

How a Lady Motorist is  
"Doing her Bit" in War-  
time.

**T**RAVELLING by train the other day I heard the question asked, "What are you doing in the great war?" and this question repeated itself over and over again to me until I fancied that it was intended for me personally.

What was *I* doing in the great war? What are a number of women doing who have homes and families to look after? Are we helping, are we denying ourselves, or working any harder to help our country and dear ones in this national crisis? Is it sufficient to feel we are sending our husbands, sons, and brothers to endure hardships in the trenches and battlefields? What can a woman with home ties do without neglecting her duties there? I cogitated over the question—in fact, it would not leave my thoughts—until a happy suggestion offered itself. *I* can help *those* of my own sex who are helping their country, and so do "my bit."

Therefore this is what I arranged.

Living in the Midlands, within thirty or so miles from the centre of munition manufacture, I am acquainted with numbers of the workers, who are toiling from morning to night in the big factories with little to brighten their lives. It was an easy matter to come in touch with several whose health was feeling the strain of confinement, and I felt sure they would do better work if for a short time their thoughts could be otherwise engaged and a healthy recreation offered them.

I am the possessor of a reliable and capable Royal Enfield sidecar combination, and journey to a munition works at midday on Saturday where, by arrangement, I meet a couple of workers and motor them through the busy streets to the quiet seclusion of shady lanes in Worcestershire and Warwickshire, where we partake of an *al fresco* lunch and get to my home in time for tea. After a rest and change, these busy people, who are out for a holiday (merely a short week-end), enjoy a real country meal sitting in a cool dining room with French window thrown wide open, through which the twitter of sparrows and robins and the song of the thrush and nightingale are heard.

Sunday is spent awheel, and the high roads shunned if possible, preference being given to the quietude of country lanes, when my guests delight in the fragrance of the flowers and trees of early summer, and the beauty of the fresh country side.

## Chestnut Sunday.

A recent trip was taken in the Cotswolds, and as it was "Chestnut Sunday," we chose the most appealing route where these magnificent blossoms could be seen in all their glory. Quite an early start was made, with lunch and tea packed securely in the locker under the seat of the sidecar, and the three of us wended our way towards Broadway. Parties of Royal Engineers were at work rectifying the damage done by the blizzard, and they must have been indeed busy to have got matters as ship-shape as they had in so short a time. Through the delightfully winding ascent in Broadway village we passed to the foot of the long hill, generally known as "Fish Hill." I secretly wondered how my Enfield would take the gradient, "with three up" and luggage, but the powerful engine never jibbed, and, knowing the district so well, I climbed the greater part "on top." We pulled up just past the summit on which stands the Fish Inn, and under the shade of some trees we were able to give assistance to another cyclist who had met with a puncture.

Motorists will do well to be wary in the districts where telephone and telegraph repairs are taking place, as nails and pieces of wire abound. My advice is to steer clear of the sides when possible. A turn to the right between a couple of stone pillars from which the gates have been removed brought our party through a

Big car, small car, and sidecar at Stanway.

**Recreation for War Workers.—**

series of fields into the picturesque village of Snowhill. The surface of these byways is fairly good, and the gates awkward, but the view is charming.

In the run from Snowhill to Ford we did not meet a soul, but at the old inn we encountered quite a bevy of motorists, some partaking of an appetising meal on the verandah.

**Lilies of the Valley.**

It may be interesting to motorists to learn that at a spot near Guiting Wood one is able to pluck, unmolested, quantities of wild lilies of the valley, whose blooms are as fine as those grown in any garden.

The fresh air was making us very hungry, so on reaching the woods on the top of Stanway Hill we dismounted and had lunch. How my guests enjoyed the home-cured ham, fruit tarts, and locally made cheese washed down with Worcestershire cider and gingerbeer, and so did I.

The drop down into Stanway village will long be remembered.

One overlooks the valley for miles, and the laburnum trees, which grow in wild profusion on both sides, were golden in their glory, the chestnut trees were lit up with their pyramid blossoms, and the scent of the hawthorn was wafted on the gentle breeze.

At Stanway a photograph was taken of the famous gateway designed by Inigo Jones, at the entrance to

Stanway House, the Gloucestershire residence of the Earl and Countess of Weymss, and here we were able to help a lady motorist who was in trouble with a big car. A little further we came in full view of the chestnut avenue on the Stanway estate. Its beauty is indescribable, the myriads of blooms, each in itself a

wonder, formed a picture never to be forgotten, and one which will remain in the memory of my guests as a bright spot during many a long tiring day.

It is surprising how much can be stowed away in a Royal Enfield sidecar, and my guests were astonished when I produced from its capacity a patent spirit kettle and stove, which will easily boil in a gale of wind, and a well-stocked tea basket. A cup of tea is always refreshing, but never before has one tasted so well as on this hot afternoon in such exquisite surroundings.

Still following by-lanes, we returned home *via* Toddington, Ashton-under-Hill, Elmley Castle, and Hinton Cross, and in the cool of the evening reached Evesham.

By quite an early start the next morning I took my war-workers back to their centre in time for business, and I felt with the aid of my staunch friend, the reliable Royal Enfield, I had not only given two indispensable munition workers a healthy recreation, but I had, in a way, done something to help the great war.

(Mrs.) M. HARTLEY-SMITH.

RECREATIVE AND RECUPERATIVE MOTOR CYCLING.

Taking women war workers for a sidecar run.

SIDECARS FOR THE ITALIAN ARMY.

A large number of single-cylinder Stucchi machines are being used by the Italian War Office, and now the 5-9 h.p. twin-cylinder model is being delivered. The illustration shows the two 6-8 h.p. outfits that underwent a 500 miles test in the war zone before being finally adopted by the War Office of our Ally.

By H. ADDISON, B.Sc., A.M.I.C.E.

IN THREE INSTALMENTS. (The first appeared on May 4th, page 422, the second on May 25th, page 486.)

THE question of balancing the horizontally-opposed twin is of particular interest, inasmuch as this class of motor cycle engine is the only one which can be literally perfectly balanced in every respect. Indeed, the engine is self-balancing, for at any moment one piston is travelling at exactly the same speed as, but in the opposite direction to, its fellow; hence the inertia effects set up completely neutralise each other without the necessity for any other balancing device whatever (fig. 8).

Fig. 8.

the engine in its usual form could not claim to be completely balanced. With the two-throw crankshaft generally employed, it is not practicable to arrange the cylinders co-axially; one of them is offset with regard to the other, consequently the inertia forces, although equal in magnitude, do not act in the same line. The result is that an "unbalanced couple" comes into play, tending to twist the engine about a vertical axis, as shown by the arrow in fig. 9 (a). Actually the

Fig. 9.

effect of this couple is quite unobjectionable; but it is possible to eliminate it entirely by using a forked connecting rod and a three-throw crankshaft, thus permitting the cylinders to be placed in line, as in fig. 9 (b).

#### The Ideal Engine.

From the practical standpoint the discussion of the horizontal twin might be left at this stage, but as

another step will bring us to the motor cyclist's ideal, the *completely* balanced engine, a few further remarks may be of interest. So far it has been assumed that the whole of the weight of the connecting rod is concentrated at the crank pin and at the gudgeon pin; no case has yet arisen where anything like complete balance is attainable, and so the slight error involved in this assumption is entirely negligible. Under the true condition of affairs, however, it may happen that on account of the oscillations of the rods about their respective gudgeons, a disturbing couple is introduced as shown in fig. 10, the inertia forces  $R$  tending to rock the engine about the axis of the crankshaft. Even this disturbance, trivial though it is, can be removed if the metal

Fig. 10.

in the connecting rods is distributed so that the "centre of percussion" of the rod, when the rod is swung about the centre of the small end, lies exactly at the centre of the big end. This condition is fulfilled if, when the rod is swinging freely about the centre of the small end, its oscillations just keep time with those of a simple pendulum having a length equal to the distance between the centres of the rod (see fig. 11). For this purpose a "simple pendulum" may be taken to mean a small metal ball suspended from a piece of thread.

To sum up, then, a twin horizontal engine would be perfectly balanced in every respect if (i.) the cylinders were arranged co-axially, as in fig. 9 (b); (ii.) the working parts of one cylinder were precisely equal in weight to the corresponding parts of the others; (iii.) the rods fulfilled the condition laid down above as regards the position of the centre of percussion; (iv.) the crankshaft were accurately balanced. None of these requirements are at all impossible of achievement, and consequently it is quite a practical proposition to construct a motor cycle engine which would run with as little vibration at 3,000 r.p.m. as at 300 r.p.m.

Fig. 11.

## The Mechanics of Balancing.—

**Balancing a Side-by-side Twin Engine.**

In this type of engine the axes of the cylinders are parallel one with the other, the crank pins being set at  $180^\circ$  (fig. 12); hence when one set of reciprocating parts is at the top of its stroke, and so exerting its maximum upward inertia force  $P_T$ , the other set is at the bottom of its stroke, thus exerting its greatest downward pressure  $P_B$ . Consequently the total unbalanced force will be  $P_T - P_B$ , that is,

$$P + P \times \frac{R}{L} - \left( P - P \times \frac{R}{L} \right)$$

which equals  $2 \times P \times \frac{R}{L}$ . Expressed in words, this means that the primary force of one cylinder exactly

Fig. 12.

neutralises that of the other, leaving an unbalanced secondary force equivalent to twice the maximum secondary force of one set of parts. The engine as it stands is, therefore, as well balanced as is possible, for, as we have already seen, no system of rotating balance weights will counteract the effect of the secondary forces.

In addition to the unbalanced force, there

will also be an unbalanced couple represented by the arrow in fig. 12; it will be much more serious than the one at work in the horizontal twin engine, on account of the greater distance  $D$  between the centre lines of the cylinders (compare figs. 9 (a) and 12). This couple will tend to make the engine "pitch" about a horizontal axis at right angles to the axis of the crankshaft; if this latter lies parallel to the length of the vehicle, as in a car, this pitching tendency will be in a fore-and-aft direction, while in the Scott motor cycle (the only well-known machine employing this type of engine) it is across the frame. There is no means of completely eliminating the unbalanced couple except by introducing an equal and opposite couple, which can readily be effected by placing two two-cylinder engines end to end.

**Balancing a Four-cylinder Engine.**

A four-cylinder engine may conveniently be regarded as two two-cylinder units coupled together, and it follows from what has just been said that there need

Fig. 13.

be no unbalanced couple in such an engine; if one unit be arranged the "opposite hand," as a draughtsman would say, to the other, the two rocking couples act in opposite directions, and so exactly neutralise one another (fig. 13).

Here we have the reason for the familiar arrangement of cranks in this engine—the two inner pins on the same axis, and the two outer pins on an axis  $180^\circ$  away from the inner ones. Although by this means the unbalanced couple is eliminated, the total unbalanced force remains unaffected, and will amount to four times the maximum secondary inertia force of one set of reciprocating parts.

It is interesting to note that if a third pair of cylinders be added, the cranks being set at  $120^\circ$ , the engine will be perfectly balanced in every respect, as regards both forces and couples. This accounts for the popularity of the six-cylinder engine among pleasure car owners; but, as the day of the commercially successful six-cylinder motor cycle has yet to dawn, the question need not detain us.

**Comparison of Various Types of Engine.**

In comparing the degree of balance or unbalance in various classes of engine, the fairest method will be to confine ourselves to engines of the same speed, total cylinder capacity, and ratio of connecting rod to crank length. This means that we shall have to deal with engines of different individual cylinder capacities, and therefore a further point that must be decided on is the manner in which the inertia force at a given speed depends upon the individual cylinder capacity. Very roughly, it may be taken that this variation is in simple proportion, i.e., halving the capacity halves the inertia force, or doubling the one doubles the other. Hence if the maximum primary inertia force  $P$  for a single-cylinder engine be represented by 100 lb., the value of  $P$  for each cylinder of a twin engine will be 50 lb., and for a four-cylinder engine 25 lb., provided, of course, that the conditions just stated obtain (speed, horse-power, etc., identical in all cases). This assumption is admittedly a somewhat sweeping one, but it is sufficiently accurate for present purposes. As before, it will be assumed that the connecting rods are five crank lengths long.

The results already obtained may now be summarised and tabulated thus:

Type of Engine. (Speed, H.P., etc., same throughout.)	Value of $P$ for each Cylinder.	Least Unbalanced Force, or "Unbalance."
(a) Single cylinder .....	100 lb.	$\frac{1}{2} P_T = \frac{1}{2} P \left( 1 + \frac{R}{L} \right)$ $= \frac{1}{2} \times 100 \left( 1 + \frac{1}{5} \right) = 60 \text{ lb.}$
(b) $50^\circ$ twin .....	50 lb.	$0.82 \times P = 0.82 \times 50 = 41 \text{ lb.}$
(c) Side-by-side twin ....	50 lb.	$2 \times P \times \frac{R}{L} = 2 \times 50 \times \frac{1}{5} = 20 \text{ lb.}$
(d) Four-cylinder .....	25 lb.	$4 \times P \times \frac{R}{L} = 4 \times 25 \times \frac{1}{5} = 20 \text{ lb.}$
(e) $30^\circ$ twin .....	50 lb.	$0.28 \times P = 0.28 \times 50 = 14 \text{ lb.}$
(f) Hor. opposed twin ..	50 lb.	$0 = 0 \text{ lb.}$

It should be explained that the value 100 has been chosen merely as an arbitrary standard of comparison; also that the figures in the last column refer to the theoretical unbalance still remaining after the engine has been balanced as well as possible.

This table reveals some rather striking facts. As we should expect, the single-cylinder engine is an easy first from the point of view of *bad* balance. Next in order comes the  $50^\circ$  twin, which is about two-thirds as much out of balance as the single. Then come the two-cylinder side-by-side and the four-cylinder

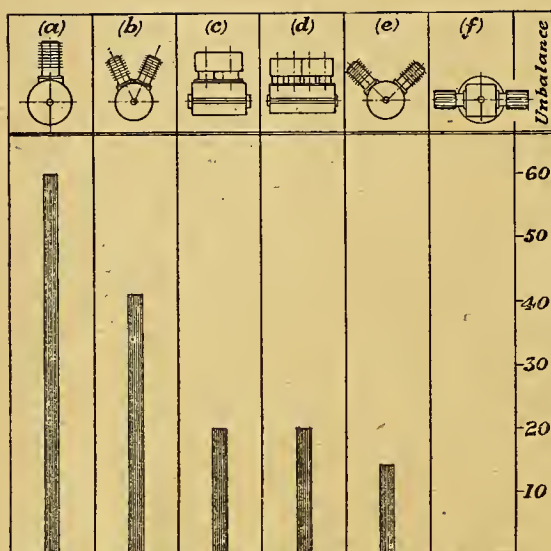

Fig. 14.

engines, both of these being only one-third as much out of balance as, or three times *better* balanced than, the single. (It may be noted in passing that the four-cylinder type has no advantage over the two-cylinder as far as the unbalance is concerned.) The 90° twin is a distinct improvement on all previous types, being about four times better balanced than the single-cylinder engine, and about three times better than the 50° twin. Finally, we have the horizontally-opposed twin with *no* unbalanced force.

It is worth while pointing out that the unbalanced forces in types *c*, *d*, and *e* consist entirely of secondary forces, and so can be materially reduced by lengthening the connecting rods.

The accompanying diagram (fig. 14) is self-explanatory, its purpose being to show graphically the foregoing results. Although several assumptions have been made in calculating the figures from which this diagram was prepared, and important matters such as unbalanced couples have been neglected, yet undoubtedly these figures give a very fair idea of the degree of balance attainable in the various types of engine that have come under review.

## AN OLD FRIEND.

### WELL-CONSIDERED MODERNISATION OF AN OLD MACHINE.

THERE must be many well-cared for and improved machines of moderate age about the country of which the six-year-old Matchless illustrated here-with is a particularly good example. The owner, Mr. J. H. Wilkinson, of Doncaster, has added many improvements to bring the machine up to date.

The engine is a 5 h.p. J.A.P. with overhead valves, the rockers of which are fitted with lubricators. These are found to be far more efficient than the plain oil holes which did duty previously.

Removable part of lower tank tube to facilitate cylinder removal on J.H. Wilkinson's Matchless.

A SIX-YEAR-OLD MACHINE MODERNISED.  
J. H. Wilkinson's single-gear 5 h.p. Matchless in its latest form.

To allow of the easy removal of the cylinder the tube below the tank was cut near each end, and two half-tap joints made so that the tank can be swung to one side after the removal of the two bolts. The free engine wheel required no structural

alterations, and Mr. Wilkinson himself made the brake and foot levers, which included a foot-operated exhaust lifter. A long exhaust pipe terminates in a car whistle operated by the right foot; this has proved very useful in traffic.

The handle-bars were originally T.T. pattern; these have been bent up to a more comfortable angle, and long handle grips made of corrugated hose pipe fitted. The carburetter is, of course, the 12-jet Wilkinson which, the owner assures us, enables the machine to be run at any speed from six to sixty miles an hour. This has a hot air pipe not shown in the photograph fitted from the union of the front exhaust pipe, which has effected a considerable improvement, both in consumption and power, especially when running on a petrol-paraffin mixture.

The occupant of the saddle is in temporary charge of the machine.

## TYPES OF AVON TYRES—No. 1.

## "Sunstone"

THE safest, strongest, and speediest of all rubber anti-skids and unrivalled for the driving wheels of high-powered machines, especially those used for heavy sidecar or pillion-passenger work.

The "Sunstone" is manufactured by the exclusive Avon Electro-hydraulic process—the latest and greatest method of tyre-building. It has a 4-ply Egyptian casing of enormous strength, and—an important feature—two plies round the beads. An exceptionally thick tread of tough rubber in-compression ensures long life and unusual freedom from cuts or punctures, while the unique design of clean-cut grooves, closed at each end, provides a really effective anti-skid.

Type.	For Machines	1½"	2"	2½"	2½"	2½" to fit 2½"	3"
Sunstone.....	Up to 8 h.p.	—	—	44/-	49/6	—	60/6
Combination .....	Up to 5-6 h.p.	—	—	53/-	55/-	57/9	59/9
Three-ribbed * .....	'Big' Models	—	—	—	—	—	48/4
Tricar.....	Up to 5-6 h.p.	—	—	38/6	41/3	44/-	49/6

1,000 Agents hold stocks. Ample supplies available.

In answering this advertisement it is desirable to mention "The Motor Cycle."

## Get this Catalogue

It is, like the Ariel machine itself, a superb and handsome production.

The book, which contains 32 pages, is printed in two colours on art paper and profusely illustrated.

All the models are shown and described, also various important Ariel patent constructional features. Many useful hints and tips, and other interesting items are given.

GRATIS ON REQUEST.

ARIEL WORKS, LTD. (Dept. A), BOURNBROOK, Birmingham.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Further Vacancies in the M.M.G.S. R.F.C., and R.E. Railway Operating Division.

This section was instituted with the sole object of assisting readers and directing them to the many different branches of the Army and Navy for which their special knowledge suited them. At the outbreak of war numerous letters reached us (and continue to arrive) from men at home and overseas possessed of motor engineering knowledge, explaining their difficulty in obtaining particulars of Specialised Sections (notably the Motor Sections), recruiting officers being invariably occupied by the demands of the line regiments. The Editor is Inspecting Officer for the M.M.G.S., Heavy Section, Machine Gun Corps, and R.E. Despatch Riders. Throughout, the work has been purely honorary, and no commissions have been accepted. To date, 9,992 readers have taken advantage of our proffered assistance.

THREE telegrams, two telephone messages, and twenty-eight letters of application were the first day's result of the appeal in the last issue for experienced motor cyclists for the sidecar batteries of the Motor Machine Gun Service. Letters have followed each day since, and appointments were made for Tuesday and Wednesday this week with suitable men.

A further request for experienced riders having been received since the last issue went to press, applications are

various parts of the country (including Scotland and Wales) for the positions announced in our last issue, and was due at the Nottingham Recruiting Office, Stanford Street, for the same purpose yesterday. The popularity of the M.M.G.S. among Nottinghamshire and Lincolnshire men is surprising, and a score or so of men having applied from these counties, the Nottingham appointment was made for their convenience in the matter of travelling.

Among recruits accepted last week for the M.M.G.S. were:

Barker, A. J. E., Northampton.  
Hamilton, E. V., Filton.  
Stanger, W., Manchester.  
Brander, F., Earlstown.  
Lock, W., Romford.

## Notice to R.E. Despatch Riders.

In connection with the Royal Engineers' despatch riders, the age of recruits in this Section must now be between eighteen years nine months and thirty-five. The examination of applicants for this section has again been rendered more stringent.

With regard to the 2s. 6d. per diem rate of pay, there seems to be a doubt about this, judging from letters received from despatch riders now in training.

It is interesting to note that Lawrence Kemp, of Coventry, a motor cyclist passed by the Editor for the Royal Engineers' Despatch Riders' waiting list last week, has served three years in the Charron automobile works of Puteaux, and, of course, speaks French fluently.

## R.E. Railway Operating Division.

A notice regarding the above section of the Royal Engineers appeared under *The Motor Cycle* Recruiting Section in the issue of June 29th, page 610. Further to the statement made in that paragraph, we are now informed by the War Office

that recruits will receive 1s. 8d. per diem on joining, with a further rise of 6d. per diem after twenty-eight days, and after a further period of thirty-two days 5s. 2d. a day. The prospects of promotion are excellent. The type of man required is one who has been through an engineering works; in fact, only fully qualified men used to lathe work are being considered. The work will entail the looking after of internal combustion engines of high horsepower, and the training will be invaluable to those who receive it in after life. Applications should be addressed to Quartermaster-Sgt. Smith, Room 550, War Office, London, S.W.

## Royal Flying Corps.

We are constantly receiving letters from readers asking us the name and address of trade testing parties for the above corps, and we are now advised by the Special Recruiting Officer for the R.F.C., Capt. H. Stuart Ebber, that a R.F.C. Special Recruiting Officer will be at the Recruiting Office, Corn Exchange, Sheffield, during this week and until the 15th inst. The party will later visit Stockton-on-Tees, Carlisle, and Glasgow. There are other recruiting parties at present stationed at Leeds, Manchester, Birmingham, and London.

## MOTOR MACHINE GUNS TO THE FORE.

A BATTERY of the Motor Machine Gun Service is engaged in the German East African campaign. Reuter's correspondent with British Headquarters makes the following reference to the battery in his description of the advance on and fight at the Lukigura River: "At three o'clock in the morning General Sheppard's Punjabis and the Rhodesians swung down the main road, making for the bridge, and at

sunrise Sir John Willoughby's armoured motor dashed to the front and engaged a pom-pom at close quarters. A splinter went through the radiator of the car, and it had to retire, but repairs were made, and the car was soon again to the fore."

The battery referred to is the Light Armoured Motor Battery which formed the subject of a double page photograph in our issue of March 23rd, 1916.

## THE MOTOR CYCLE IN THE R.N.A.S.

An air-mechanic and former Tourist Trophy rider has a few minutes to spare after tuning up the engine of an R.N.A.S. aeroplane.

still invited. Readers ready to join immediately and conforming to the conditions of enlistment below may attend without notification at the Coventry Recruiting Office, Masonic Hall, on Tuesday next, the 11th inst., on which date an inspection has been arranged. Those applicants accepted will proceed at once to the training centre. Reserve cards should be brought for reference.

For the guidance of prospective recruits, the conditions of enlistment are appended:

Applicants must be experienced car drivers or motor cyclists, able to execute ordinary running repairs.

Pay, 1s. 2d. per day, all found.

Enlistment for duration of war.

Usual separation or dependants' allowance.

Age limit, 19 to 40.

Applicants must be fit for General Service abroad, or for Garrison Duty abroad.

On Tuesday last, the 4th inst., Mr. Geoffrey Smith, Editor of *The Motor Cycle*, attended at the Recruiting Office, Coventry, to examine applicants from

A Russian officer on his P. and M. The rider, M. Worobieff, tells us that all his company are equipped with motor cycles of this make.

## SIDECAR DEVELOPMENTS.

### A LIMOUSINE TOP.

THE accompanying photograph has been sent to us by Mr. Leon McVicker, who gives the following particulars of the arrangement. The limousine top is coachbuilt, has celluloid windows, and weighs but 9 lb. It is

Detachable limousine top for sidecar, designed by Leon McVicker.

detachable and easily removed when not required. The outfit was regularly used last winter, and no trouble was experienced from head winds. The top obviously affords the passenger very complete protection against the elements. The motor cycle to which the sidecar is attached is a 4 h.p. New Hudson. This has given its owner great satisfaction.

### A GOOD DESIGN.

AN indirect result of the advent of the cheap car has been that increased attention has been paid to the comfort of sidecar passengers, and in particular their protection from the elements. Cape cart hoods and short screens are now seen, but they still leave room for improvement.

The asting screen in its present form. The complete design, when completed, will appear as in the sketch reproduced above. The photograph shows the designer driving his B.S.A. The inset shows the screen minus the top cover.

Design of detachable top for sidecar body provisionally patented by C. A. Easting. The circle shows the manner in which access is gained to the seat. Quickly detachable celluloid panels are used, and if desired the front screen only can be used as shown in the photograph below.

Quite one of the best attempts to provide protection for the sidecar passenger is that illustrated herewith. The arrangement, which consists briefly of easily detachable celluloid screens and canvas apron and top, has been provisionally patented by C. A. Easting, insurance broker, of 59, Abbey Road, Warley Woods, Birmingham. Mr. Easting is a keen motor cyclist, but his wife does not enjoy the best of health, and in order that she might enjoy sidecarring under adverse weather conditions, Mr. Easting evolved his detachable screen and hood.

At present only the front half circle shaped screen has been made, and this, with the front apron, provides good protection for the passenger. The complete design, as shown in the sketch, provides for the continuation of celluloid panels at side and rear, so that, with all in position and the canvas top, a completely enclosed seat is the result. The whole affair is light and quickly and easily detachable. Arrangement will be made for carrying the panels when not in use in a case at the back of the sidecar.

### A NORTON INNOVATION FOR CARRYING A CHILD.

THE problem of carrying a junior extra passenger often confronts the family man who owns a sidecar outfit, and there are several methods of "stowing away" the child. Unfortunately, from the child's point of view, "stowing away" more aptly describes the usual methods, such as jamming the poor infant into the toe of the sidecar, perched on a stool, or petrol tin, and, incidentally, cramping the adult passenger; or again, the more dangerous mode of putting the child on a cushion on the carrier to hang on as best he can. There are also several makes of double-seated sidecars on the market, but most of them are remarkably heavy.

During a recent visit to the new works of Norton Motors, Ltd., at Phillips Street, Aston, Birmingham, we inspected a clever idea, which solves the problem effectively and neatly. In the usual pattern of Norton sidecars the back of the body forms a very commodious store for kit and luggage. Very little of this space has been occupied in the fitting of the miniature dickey seat. The back part of the body is hinged at the bottom, and two flat metal arms hold it firmly

## NEWS FROM GERMAN EAST AFRICA

German East Africa is certainly an interesting place from which to get reports on Dunlop motor-cycle belts! And when I hear that *every* belt-driven machine used by the Dispatch Riders under General Smuts' command is fitted with a Dunlop round-top belt, I draw my own conclusions, i.e., that the rigours of active service conditions have served to demonstrate the inherent superiority of yet another Dunlop product.

# Sunbeams IN THE FIRST FRENCH LINE

## EXTRACT FROM LETTER.

"The Motor Cycles you supplied to us some time ago for the transport of Wounded French Soldiers in the Vosges Mountains have done, and are still doing, most excellent work in the first line of the French Army. These Cycles are spoken of in THE HIGHEST TERMS by all who have come in contact with them in France."

What satisfaction is expressed in these words—recognise the difficulties of heavy ambulance work over any and all sorts of so-called roads which strains every part and portion of the machines.

SUNBEAMS under such a test are spoken of "IN THE HIGHEST TERMS." No better testimony is needed of the Reliability, Workmanship, and Superiority of SUNBEAMS.

Owing to the great demand for Sunbeam Motor Cycles for War purposes, the public are respectfully informed that further deliveries cannot at present be made from the Works, and those who require Sunbeams should purchase the existing stock of the various Agents who have had the foresight to provide for this contingency.

### ARRIVAL OF THE SIDECAR DICKEY SEAT.

A development of the capacious folding locker, forming the bulbous back of the Norton sidecars, is that of making it into a dickey seat for children, as illustrated.

at an angle of about 45°. The centre of the cover board of the locker is cut out and a small upholstered seat is pivoted so as to shut up flush with the cover when not in use. A padded back rest is provided, and further elaborations will probably be added to give additional comfort. It is both strong and safe, as well as roomy, for a child; it is not in any way unsightly, and adds practically nothing to the weight of the sidecar. It does not affect the balance of the sidecar, and the whole outfit, with driver and one and a half passengers, rides as easily as can possibly be desired. We might suggest the addition of folding canvas side pieces to exclude the dust, raised by the passage of the outfit over the road.

Credit is due to Mr. Watson, the designer of Watsonian sidecars, who is responsible for the idea. At the same time, it should be noted that it is protected, and is supplied exclusively with Norton outfits.

### A WRIST WATCH PRO- TECTOR.

A WRIST watch may almost be considered part of the personal equipment of a well rigged motor cyclist, so great are its advantages for riding over a watch carried in a vest pocket. Since the war the use of wrist watches has spread enormously, they being very popular with soldiers of all grades, and for military motor cyclists they are a *sine qua non*.

Being carried in a somewhat exposed position there is always the risk of breakage of the glass, and to get over this trouble Hirst Bros. and Co., Ltd., of Roscoe Street, Oldham, have introduced the "Mesh Guard" illustrated. It is made of metal for fitting over the watch glass, and the squares are so designed, we are told, that each of the twelve-hour figures has its own individual square.

Hirst Bros.' wrist watch protector.

### IRISH TRIAL RESULTS.

THE awards in connection with the Twenty-four Hours Trial of the Dublin and District Motor Cycle Club, reported in our last issue, were announced on Friday last. Eight of the nineteen competitors secured full marks at the open controls, and made clean runs through the non-stop sections, and consequently the awards depended on the variation from schedule time at the two secret controls. W. H. Freeman was found to be but 13s. out, W. J. Henderson 15s., and A. W. Mooney 23s. Freeman consequently wins the Rudge-Whitworth Cup, and this being his second successive win the cup becomes his absolute property.

The prize for the best performance of a team of three riders was won by Messrs. Mooney, Dooly, and Lucy. The passenger machine prize, for which the winner of the Rudge-Whitworth Cup was not eligible, was won by W. J. Henderson, and the lightweight prize by C. E. Franklin.

The markings of the nineteen finishers were as follow:

#### GOLD MEDAL WINNERS.

	Marks.
W. H. Freeman (7-9 Indian) .. ..	200
W. J. Henderson (7-9 Harley-Davidson sc.) ..	200
A. W. Mooney (7-9 Excelsior sc.) .. ..	200
S. A. Allen (3 Enfield) .. ..	200
P. Grimes (7-9 Indian sc.) .. ..	200
A. Carton (7-9 Indian sc.) .. ..	200
T. Woods (4½ B.S.A.) .. ..	200
F. L. Dooly (4½ B.S.A.) .. ..	200
F. McDonagh (4½ B.S.A.) .. ..	199
C. S. Kettle (4½ B.S.A.) .. ..	199
D. Lucy (2¾ Douglas) .. ..	198

#### SILVER MEDAL WINNERS.

R. Walshe (4½ B.S.A.) .. ..	198
F. Cunningham (7-9 Indian sc.) .. ..	196
C. B. Franklin (2½ Indian two-stroke) ..	193
J. Stewart (2¾ Douglas) .. ..	193
C. S. Redmond (3½ Indian) .. ..	190
Cpl. J. Griffiths (2¾ Douglas) .. ..	180
T. Toole (4½ B.S.A.) .. ..	171
T. J. Dunphy (3 Enfield) .. ..	170

Walshe missed a gold medal by being early at an open control.

### WORTH REMEMBERING.

The rider of a two-stroke machine fitted with chain-cum-belt drive had the misfortune to break the magneto chain five miles from anywhere. Fortunately, he discovered that the driving chain, of which he had a spare, was of the same pitch as that for driving the magneto, and he therefore shortened the spare chain and used it for the magneto.

### LEST WE FORGET.

IT has occurred to us that a fit and proper way of perpetuating the memory of the late Sir R. K. Arbuthnot, Bt., C.B., M.V.O., would be that the Auto Cycle Union, of whose committee he was an active member, should put up a challenge cup, to be known as the Arbuthnot Trophy, to be competed for by officers of the Royal Navy. It may seem somewhat strange at first that we should suggest that a sporting trophy should be employed for the purpose of commemorating the life of a great man who died a hero's death, but the case is an exceptional one. Here we have a gallant sailor who, if he had lived, would have received many honours at the hands of King and country, and who devoted the major portion of the little spare time he had to his motor bicycle. He was not only a keen rider and a hard rider, but he worked diligently for the movement when he could, and his good work will long survive him. By popularising the motor bicycle in the Navy he helped to spread the pastime among the general community. That is a point which must not be forgotten. His name is inseparably coupled with his profession and with his favourite sport; therefore we argue that the cup which is to perpetuate his memory should be a trophy to be won annually in a motor cycle competition, and that the competitors should be officers of the Senior Service in which he had so distinguished a career. There will be difficulties, we admit. The naval officer is a keen and skillful rider, but his leave days are few and far between; still, that the right kind of competitor can be got hold of we are sure.

We would finally suggest that all who wish to contribute to a trophy to perpetuate the memory of one who may be said to have been the premier motor cyclist of Great Britain, should send their donations to the Secretary, the Auto Cycle Union, 83, Pall Mall, S.W., as soon as it is announced that that body is willing to organise the event. We do not, of course, suggest that the competition would be held until after the war.

A lady rider of a Harley-Davidson showing her neat and suitable attire.

## TIMES TO LIGHT LAMPS.

"SUMMER" TIME.

July 6th	...	...	9.46 p.m.
" 8th	...	...	9.45 "
" 10th	...	...	9.44 "
" 12th	...	...	9.42 "

## Sidecarriers and the Increased Petrol Tax.

Owners of sidecarriers who use their machines *exclusively* for business purposes are not affected by the increased petrol tax. When the additional tax comes into force, the ordinary user will pay 1s. per gallon in tax, whilst commercial vehicle users will only pay 1½d. per gallon in tax.

## "Cleveland Triumphs Again."

The above is a heading to an advertisement in an American contemporary of the Cleveland lightweight, that has been illustrated in these pages. The heading is rather amusing, in view of the undoubted external likeness of the Cleveland to the Baby Triumph.

## A Lost Machine.

Enquiries are being made for the whereabouts of a 5 h.p. 1915 model Indian that belonged to a man who lost his life on the *Invincible* in the Jutland naval engagement. Up to the time of writing all efforts to trace the machine have failed, though it is thought it may have been garaged somewhere on the east coast of Scotland. Registration number is BK 3212, and it had a Stewart speedometer and Lucas lamp. Any information that may lead to the machine's recovery should be sent to Mr. Gordon D. Dewar, 127, Festing Grove, Southsea.

## Liverpool Motor Cyclist Volunteers.

The Motor Cycle Section of the National Motor Volunteers, at Liverpool, recently held an inter-squadron team relay despatch carrying contest. The general scheme was the carrying, in the quickest time by teams of four men acting in relays of a despatch from Sefton Park to Hale, *via* Kirkby Station, Rookery Station, Collins Green, and Sankey Station. This course was specially chosen for its comparative easy nature in view of the fact that this was the first event of its kind. Four teams completed the journey, the best performance being only 40½ m., or an average speed of 20 m.p.h., which, taking into consideration that the way had to be found by map alone, seems extraordinarily good. Each of the winning team received a pocket compass as a prize. A somewhat similar contest is down on the programme for July 23rd.

## Women driving all Types of Road Vehicles.

A fortnight ago we commented upon the steady increase of women motor cyclists. But this is only one type of motor vehicle women are driving nowadays. They can be seen driving sidecarriers, light vans, and touring cars all over the country, and one day last week a young girl was seen driving a 3 ton Army lorry. And she was handling it very well, too.

## Importation of Commercial Motor Vehicles Prohibited.

As from July 6th the importation of commercial motor vehicles (in which are included sidecarriers) and chassis into this country is prohibited except under certain conditions.

Licences to import will be granted in cases where the goods were either *en route* for the United Kingdom or actually paid for at the date of the Proclamation, and also where it can be shown that the importation is desirable in the national interests or where the car is urgently required for any of the purposes specified in Class A of the Order of Priority for the distribution of motor spirit or for agricultural purposes, or for the conveyance of essential goods. Licences will further be issued for the importation of spare parts for imported commercial vehicles which are already in the United Kingdom.

A SPEEDY SIDECAR

## More Petrol Substitutes.

We extract the following from last week's *Punch*:

"The following letter was received from a Chinese storekeeper, in response to an order for benzine:

"Madam,—Very sorry we have no benzine, but we have ground cloves, nutmegs, cinnamon, and ginger. Hoping to be excused for the trouble."

"Victims of the petrol census may be glad to know of these substitutes."

## Cruelty to Lightweights.

The reader who writes to us and asks if his 2½ h.p. lightweight is big enough to take a sidecar should bear in mind the following extract from the excellent little booklet published by the Villiers Engineering Co., Ltd., on their 2½ h.p. two-stroke motor: "As engines are easily liable to derangement by neglect and misuse, our guarantee does not apply to defects caused by wear and tear, misuse or neglect. The term 'misuse' usually includes . . . the attaching of a sidecar to the motor cycle driven by this engine."

The machine is an A.B.C., and the rider will be recognised as J. L. Emerson, a Brooklands record-breaker.

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

NEVER have the lonely wilds of Wrynose or the rugged crags of Hard Knott seen anything like the coming of the munition men, at least not since those far-distant days when Roman legions made the seaward slopes of the westerly pass their abode and training ground. But the modern chariot is not noisy in its movements, and, as we struggled up the Wrynose steeps, from everywhere came the echoing bark and whirr of motors. All were not victorious on Wrynose or its approaches, and as we came from northern Lakeland, a Rover, left derelect, was passed on Owlett Hill, and there were

machines crossed the notorious pass speaks well for the efficiency of modern construction. Amongst the light machines the 2½ h.p. Douglas and the 2½ h.p. Royal Ruby figured prominently. The former was skilfully handled by B. Boyren, of Barrow, whilst George Braithwaite, of Kendal, "fairly ate up everything," as a keen Yorkshire spectator described it. The silent steady stride of the 3½ h.p. Scott was worth noting, the more so as the machine, ridden by H. Harland, had just come from Hull specially for the day's sport. Another distant visitor was Gilbert Browne, a keen despatch rider, who, on special leave, had come from the

others. After the previous day's heavy downpour, we were not surprised to pass many machines left at the foot of the climb and others at various stages of the ascent.

The lower slippery grass corner close to Fell Foot Farm had caused little serious trouble, and it was on the upper section, the most trying part of Wrynose, where real "liveliness" was in evidence. About a dozen machines were more or less held up, or kept down, by the grip of gravitation. The slimy, sliding slope of stony looseness, set at an angle verging on 1 in 3, which forms the road, was in very bad condition, and nobody made a complete non-stop climb at the first attempt. Doubtless this was partly caused by the hurried nature of the attack, for all were anxious to reach Cockley Beck farm at the further side of the pass and meet another large batch of munition workers, who had come up Duddon Dale direct from Barrow-in-Furness.

#### Wrynose.

Still, to climb Wrynose at all on such a day was a remarkable motor cycling feat, and the fact that over a dozen

sunny south to his native mist and mountains. Amongst the sidecars an 8 h.p. Enfield, driven by H. Cleary, performed splendidly. The same must be said of the 6 h.p. A.J.S., which, though carrying a huge load, reached the summit in charge of Harry Whinnerah. A 2½ h.p. Humber, driven by R. Chaplow, secretary of the Westmorland Club, also climbed well.

#### Spring Frames on Freak Hills.

On the westerly side of Wrynose there was still greater "stir," for more than a dozen of the Barrow contingent were encountered struggling bravely up. Thanks to some marvellous gymnastics, the English machines made especially good non-stop ascents. Those noticed on the other side of Wrynose were again conspicuous, and both T. Dudson, on a 3½ h.p. Rudge Multi, and W. Tomkins, on a 6 h.p. Matchless, made fine ascents. On the other hand, the uncertain performances of others led to general remarks regarding the unsuitability of spring frames for the class of work in hand. A recent kindly criticism on this point by "Ixion" in the pages of *The Motor Cycle* was recalled by the writer,

## The Conquest of Wrynose

(Centre top) Riders of 2½ h.p. Royal Ruby (Left) The second hairpin on Hard Knott followed by H. Harland (3½ h.p. Scott) (Right) Big twin-cylinder solo machines on (6 h.p. Matchless) followed by A. Walker (6 h.p. Matchless) (Lower centre) The party at Cockley Beck

whose remarks in a former article have been questioned: Would that "Ixion" could have been present on Wrynose or Walna Scar, for evidently he does not realise the kind of hills which the sporting munitioners have been tackling. A solid frame was obviously best, for there was absolute danger in being sprung into

between Wrynose and Hard Knott Passes.

mid-air and flung down the precipitous  
mountain side. Space forbids detailed  
description of the further adventures on  
Wrynose: suffice it to say that, despite  
the laggards and those who would not  
linger for lunch, over two dozen machines  
were gathered together during the picnic  
part of the programme at Cockley Beck,

the half-way halting place between the  
two passes.

## Hard Knott.

A busy afternoon was spent in climb-  
ing Hard Knott Pass from both sides,  
though some, having once descended the  
farther side to Eskdale, seemed satisfied  
to stay there. The main features of the  
Cockley Beck side of Hard Knott were  
its dozen "hairpins" and comparatively  
good surface. The lower double bends  
proved exciting, and some of the side-  
cars made skids that scattered the road  
surface and spectators very effectively.  
The two 3½ h.p. Indians, driven by J. H.  
Wilson (Grasmere) and B. Pole (Barrow),

where the gloomy crags of Hard Knott  
loomed threateningly.

The weather now became somewhat  
damp, yet this did not deter several  
enthusiasts from tackling the westerly  
side of Hard Knott, which must cer-  
tainly be considered the most difficult  
part of the two passes for motor cycles  
as well as cars. Undoubtedly the best  
performance here was made by George  
Braithwaite, on the 2½ h.p. Royal Ruby,  
for, except for a momentary halt through  
the crank case wedging in a big mass of  
turf near the summit, he made a full  
length non-stop run. B. Boyren, on the  
2¾ h.p. Douglas, was almost equally  
successful, except for a stop on the

By **GEORGE D. ABRAHAM.**

Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures  
at Home and Abroad," etc.

took the corners steadily, whilst the  
5 h.p. of the same make, ridden by J.  
W. Wilson, of Kendal, was up midst  
the brackened heights on the skyline  
almost before one realised its success.  
Of the bigger machines, the thrilling  
attack of C. Dyson (5-6 h.p. Ariel),  
Stanley Bewsher (8 h.p. Bat), and A.  
Walker (6 h.p. A.J.S.) enlivened the  
proceedings, whilst the skilful handling  
of a single-speed Triumph by R. F.  
Sharratt deserved attention. The splendid  
dash of young Eric Peacock, another one-  
armed member of the party, was so sur-  
prising that the writer unfortunately  
forgot to note the make of his machine.  
This rider made a remarkable recovery  
when one of the descending Indians  
jumped a hairpin bend prematurely, and,  
landing in the road below, left only a  
few inches of wheel grip on the edge of  
the precipice for the up-coming climber.  
Half-a-dozen sidecars succeeded in reach-  
ing the top, and finally the quiet, steady  
ascent of a P. and M. outfit was especi-  
ally soothing after the uproar of the  
crowd foregathered in the summit mist,

treacherous hairpin below the upper zig-  
zags. This portion of the climb was  
tackled successfully by several riders.

## Good Climb by a Single-cylinder Outfit.

From the average spectator's point  
of view, the climb by T. Wilson, on  
the 3½ h.p. Rover with light sidecar  
attachment, was most remarkable. The  
astonishing agility of the one-armed  
passenger, young Eric Peacock, did  
almost more than anything else to make  
success possible. The way he shed him-  
self and rescued the outfit on the pre-  
cipitous outside edge of the lower hair-  
pin, whilst still keeping all on the move,  
was one of the most stirring sights of  
an exciting day. The crowd on the  
upper "hairpin" spontaneously cheered  
the plucky pair as they swung upwards  
and out of sight in the clouds. Then,  
after some of the bigger machines had  
shown their paces, the party was  
scattered by the oncoming storm. Thus  
ended a glorious day, which will live  
long in the memories and records of  
motor mountaineering in Lakeland.

## CHAT (continued)

## "Notice to Quit."

The Germans have "got the push," to use a term with a double meaning.

## Motor Cyclists Ineligible.

The list of motor cyclists ineligible for military service or discharged, which we compiled some weeks ago, was applied for by another Birmingham manufacturer last week. Will those on the list who obtain positions kindly notify us, so that their names may be removed?

## The Petrol Census.

A correspondent writes from Eskdale to say that, as no daily papers reach that place, he only heard of the petrol census after the last date given for filling up the forms, when he saw particulars in *The Motor Cycle*. Certainly the technical papers should have had ample notice of the proposed census.

## The National War Funds.

At the week-end the principal war funds stood as follow:

The Prince of Wales's National			
Relief Fund	£5,328,000		
(distributed)		£5,914,220	0 0
British Red Cross Fund		4,025,140	0 0
Tobacco Fund		109,499	6 11
The Queen's Work for Women			
Fund		169,599	3 4

## Cattle on the Roads.

A decision of considerable importance to motor cyclists was given by Judge Harington at the Reading County Court last week. In January, Lt. A. D. Ross was driving his wife in a sidecar, and encountered a herd of sixty cows. He slowed up, but one of the cows ran into the sidecar and overturned it. Judgment was given against the owner of the cows, on the ground that he had not exercised sufficient care in providing only one man to look after the cows. This seems to us a most just decision.

## Petrol Supply.

All petrol users are anxiously awaiting intimation as to the commencement of the petrol permits, but no official statement has yet been made. In the meanwhile, however, it is worth drawing attention to the statement made last week by the Chancellor of the Exchequer when questioned as to the position of a motorist stranded far from home with an empty tank and his petrol licence showing that he had purchased all the petrol to which he was entitled. Mr. McKenna stated that the unfortunate motorist would not be able to buy any more, and would have to trust to a friend coming along who would offer a helping tin.

## The Sailors this Time.

The sidecar outing to be organised on July 8th by the Harley-Davidson Motor Co. will be for the benefit of sailors who were wounded in the recent great naval action. The men will be transferred from the R.N. Hospital at Greenwich to South Palace Yard, Westminster, outside the House of Lords, and a start will be made thence at noon for Lord Northcliffe's seat, Sutton Place, Guildford, which is just off the Ripley Road. Owners of Harley-Davidson sidecar outfits who are able to co-operate are requested to get into communication with Mr. J. A. Masters, the Harley-Davidson Motor Co., Ltd., 74, Newman Street, W.

## More Petrol Figures.

In reply to questions asked in the House last week, it was stated that the total import of petrol spirit into the United Kingdom in the twelve months ended May 31st, 1916, was 144,000,000 gallons. The quantity imported apart from that used for Government purposes cannot be stated. The quantities on which duty was paid in the same period were: At commercial rates, 48,500,000 gallons; at private rates, 65,100,000 gallons; total amount on which duty was paid, 113,600,000 gallons.

## Another Advantage of a Motor Cycle.

Near Dunchurch on Sunday afternoon, about 4.30 p.m., two M.M.G.S. men—one on a twin Rex sidecar, the other on a Triumph—passed us at a lively bat. Evidently they were on the way to camp after short leave. Service men who travel by train have to start back an hour or two earlier to that district owing to the restricted Sunday train service, and men must, of course, report at the time they are due back. Thus a motor cycle is cheaper to run than the cost of railway fare, and the leave is prolonged.

## Meeting a Meat Eating Beast.

Encounters with wild beasts are fortunately not a thing to be expected or to take precautions against in this country, but it appears that a motor cyclist clergyman, when riding in Wales recently, came almost face to face with a savage-looking brown bear who was at that moment engaged in dining off mutton (uncooked). Putting on all speed, the rider flashed by, a mile or so further on passing a gipsy encampment, from which it is probable the bear had escaped.

## In Memory of a Gallant Sailor.

At the A.C.U. committee meeting this evening (Thursday) Mr. E. M. P. Boileau (*The Motor Cycle*) will move a resolution to the effect that, in order to perpetuate the memory of the late Rear-Admiral Sir R. K. Arbuthnot, Bart., and his association with the motor cycle movement, a challenge trophy be put up. It would be known as the Arbuthnot trophy.

## PETROL SUBSTITUTE.

It was reported last week in the daily press that Mr. F. W. Bricknell, the Hull City Engineer, had arranged for a six months' supply of motor fuel at 8d. a gallon. This seemed too good to be true, and that our scepticism was justified is proved by the following letter from the gentleman in question in reply to an enquiry we addressed to him:

## PETROL SUBSTITUTE.

"Sir,—Referring to yours of the 29th June, the report to which you refer is totally inaccurate.

"I informed my committee that I was making a contract which would effect a saving of about 8d. per gallon on present prices, but as the supply was limited and not marketed I suggested that no entry should be made in the minutes, and asked the reporters not to mention the transaction. One of them, however, who, I believe, is a motor cyclist, became unduly excited, and, it appears, sent a report to the Central News, with the result that I am to-day inundated with enquiries.

"As a matter of fact the spirit is a petroleum spirit of a somewhat higher specific gravity than Taxihus.

F. W. BRICKNELL."

# "The good old ZENITH" —but read the letter—

Zenith Motors, Ltd.,  
Hampton Court.

Hull, 16/6/16.

Dear Sirs,

You will no doubt be interested to hear that the 6 h.p. Zenith, which was supplied through your local agent just three years ago, is still running as well as ever.

Its mileage to date is approximately 60,000, and I have never once been hung up with mechanical trouble. I have found it to be a most economical machine in every way. The Petrol consumption has been very satisfactory, averaging close upon 60 m.p.g., and I do not find that the Gradua Gear appreciably shortens the life of a belt.

I think a word of praise is due to the finest machine I have ever ridden—"the good old ZENITH."

Yours, etc.

A "Clutch and Countershaft" type, with Kick Starter, Positive Locking Clutch, longest Belt Drive, and the Gradua Gear.

Models from 3½ to 8 h.p.  
Catalogue with pleasure.

#### Copper Cooling Devices.

Sir,—I am sorry I have not replied to Mr. Donaldson's letter sooner. I shall be very pleased to give full particulars as to making and the results of using these radiators. I may say I am now getting 81 m.p.g. out of my heavily laden De Luxe Norton sidecar outfit over long runs—a marked increase on my consumption previous to fitting the radiators.

A. LINDSAY (CAPT.)

#### Piston Tap or What?

Sir,—I have had recent experience on the subject. After taking down a 7.9 h.p. Indian, to fit a new big end bearing, I was troubled with a slight scraping knock which apparently emanated from the front cylinder. I put down the cause to lack of lubrication, and on testing the mechanical oil pump I found practically no oil was being delivered to the front cylinder. After cleaning the pumps and slightly increasing the flow of oil the knock completely disappeared. The Indian is, of course, fitted with a lead direct from the mechanical pump to the front cylinder.

H. W. KILBY.

#### Spring Frames on Freak Hills.

Sir,—Referring to "Ixion's" remarks on the spring frame for freak hill-climbing, I might say that if he will try a hill like Walna Scar on one of these machines he will find, when he meets with a piece of rock standing above the level of the road, he is lifted up, and when he drops again he rebounds with the springing, and probably meets with another piece of rock and does the same thing. What chance has he of climbing a hill like this when he is constantly doing gymnastics in the air? There is no doubt the spring frame machine is very comfortable on the main road.

J. G. BETHWAITE.

#### A Trip to Imbros.

Sir,—I ask you, in fairness to myself, to publish this answer to a letter which appeared in your issue of June 22nd.

This may help your three correspondents to remember the incident. I was staying for a few days only in Imbros, and had gone from the R.N.A.S. camp to the departure office to find out if trawlers were leaving, as the weather was rather rough and delayed departures were frequent. One of the three correspondents was sent down with the Clyno outfit to meet me, and was good enough to let me ride back.

I trust the disclosure of this fact has not caused any trouble, which is the only explanation I can see for the curious, though rather unnecessary, denial.

G. L. ROSSITER.

#### Four-cylinder Engines.

Sir,—I was very pleased to see Mr. Thompson's letter on June 29th. If Mr. Lee does not avail himself of Mr. Thompson's offer, I should be pleased to borrow the patterns, with the owner's permission. It is a good sporting offer of his. I must also thank Mr. Thompson, as since cleaning the magneto and taking the inner tube out of the silencer my machine has improved in starting, slow running, and picking up on top. I have trouble with the back wheel continually slacking back on its bearings. The makers cannot suggest a remedy except punching the threads of the nut. Can any of your readers suggest something permanent?

CHARLES H. VOWELS.

#### Average Speed.

Sir,—I have been very much interested from time to time regarding the average speed of some of your readers. Having heard several fellows talk lightly of averaging 40 m.p.h. on a long run, I decided to see exactly what my machine (T.T. Scott) would do the journey from North London to Pontypridd—a distance of 176 miles—with a 10 st. passenger on the carrier, I myself weighing 13 st.

Starting at 11 a.m. we covered the first eighty-eight miles in three hours and the remaining eighty-eight in 3h. 10m., at an average running speed of 29 m.p.h.

Now, I was running all out practically all the way, towns and villages excepted, and I venture to say that few machines would overtake me for any length of time on account of water cooling and wonderful speed at which curves can be taken on the Scott. I have been the owner of three machines prior to the Scott—all first-class makes—and can safely say that for speed on give and take roads they cannot be compared with the Scott.

It seems absurd to hear men say they averaged 40 m.p.h. for the run, when I know from experience that I can invariably leave them should I come across them on the road.

I have just seen a Scott taken down for decarbonising after 3,000 miles, and was surprised to find all the rings were absolutely free in their grooves. I may say I have nothing to do with the Scott Engineering Co. beyond that of a very satisfied owner.

A. COLLINGS.

Triumph mounted motor cyclist of the Royal Flying Corps. The machine is one of the latest 4 h.p. countershaft models with the semi-T.T. bars, and is the type now being supplied to the R.F.C.

### Wounded Soldiers' Outings.

Sir,—I am rather envious of the various tellows I see from time to time in your excellent photographs of "Wounded Soldiers' Outings." I suppose there is no chance of one being held down here (Portsmouth), as I should dearly like to be on "the road" again, for I have now been separated from "the old 'bus" for eight months, "owing to business abroad," and my home is in Birmingham, so there is no chance of visits from friends.

T.T. TRIUMPH.

[Perhaps the publication of this letter will induce some patriotically-minded motor cyclist (and what motor cyclist is not patriotic?) to fulfil the desire. Others in different centres might follow suit.—Ed.]

### The Public Schools Motor Cycle Club.

Sir,—I note with considerable astonishment that it is suggested a Public Schools Motor Cycle Club should be formed. I am sure that many readers of *The Motor Cycle* have not forgotten that in 1914 a club bearing this title was already in existence. This body had its registered offices at 17, Basinghall Street, and was a very active and energetic little club. It was open to past and present members of the Public Schools and of Woolwich, Sandhurst, Osborne, and Dartmouth. As regards the Public Schools whose members it admitted, these were taken from the list drawn up by the Public Schools Club.

May I point out that this club is not dead but dormant? It has a record to be proud of, and its committee and members have acquitted themselves nobly for King and country. Clive Preen, the secretary, is at present doing Government work in Egypt; C. Q. Roberts and Tallboys-Getting were both killed in action; B. C. Barton is in the Army Service Corps in France; R. L. Keller and P. C. Douglas in the Royal Flying Corps.

Is it fair to advocate the organisation of another body at the present time when our own club is necessarily dormant owing to its committee and members being otherwise engaged? It is a properly recognised club, duly affiliated to the Auto Cycle Union, under whose auspices it held numerous competitions, such as inter-Public Schools race meetings at Brooklands, hill-climbs, and week-end runs. In its competitions there took part both past and present members of our great Public Schools, and the naval and military training centres, and there is no doubt that it fulfils the duty which it was intended to fulfil. I therefore ask for fair play. As soon as the war is over the club will use its endeavours to foster the sport. A. Q. ROBERTS.

HEALTHY RECREATION AT THE M.M.G.S. TRAINING CENTRE.

The C Battery 'eam in the recent cross-country race. The winner, Knight, is shown by a x. The names are: Back row (left to right), Elliott, Miller, Martin, Lovat, and Evans; front row (left to right), Stott, Knight, Harnes, and Bacon. The man in uniform is Batt Sgt.-Maj. Keen

### Petrol War Tax.

Sir,—I feel sure that the motor cycling community as a whole are grateful for the good influence of *The Motor Cycle* on their behalf in materially assisting towards the present more equitable form of taxation. I for one shall quite smilingly pay up—and economise. I confess when I first read the news I was filled with joy at the thought that the thousands of cheap over-powered non-British cars and the huge road-destroying commercial lorries would at last be compelled to toe the line with us at least in one degree. And now my "envy, hatred, and malice" will soon turn to downright cursing and swearing. Why should the tradespeople and manufacturers get off? Hundreds of shopkeepers who keep a small pleasure car, when they heard of the proposed tax, quietly hung the business plate on the back of the car—and smiled! I know a watch repairer who used a small car, but has recently hung up his name and address, and so converted his car "for business only." Now, how on earth is anyone to know should the watchmaker decide to deliver a watch two miles away by going a pleasant fifty mile run to do so? I am quite sure private car owners and motor cyclists would like to see all types of petrol using vehicles bear with them the sixpenny petrol tax for the duration of the war.

SPARTING PORSON.

### Piston Tap or What?

Sir,—Regarding the article by "Trials Rider" on piston tap in your issue of May 25th, I had an experience a few weeks ago which, I think, throws some light on the subject.

About three months ago I took over a new Triumph (1915, countershaft) and "ran it in" very carefully. After about 1,000 miles the machine was running perfectly, the engine being particularly quiet. On dismantling the cylinder for cleaning, however, I accidentally snapped the lower piston ring, and, not having a spare handy, I replaced the cylinder minus the bottom ring, thinking that I should benefit by the oil groove thus formed.

On returning the machine to the road I was surprised to hear a peculiar tapping when running under certain conditions. I thought at first that it was play in one of the tappets, but on examination the adjustment proved to be correct. The tapping was very distinct when running at about 10 or 15 m.p.h., especially after a stretch of hard driving, but on opening out again it would entirely disappear. I soon discovered that the trouble was due to a slight piston rock, owing to my removal of the bottom ring, which would naturally have a steadying effect on the skirt of the piston and compensate for any slackness between the piston and cylinder walls. On replacing the ring the trouble entirely disappeared.

I should be pleased if you could find room for this letter in your columns, and should like to hear other readers' experiences on this matter.

A. RYCROFT.

B.E.F., France.

### Petrol Waste.

Sir,—From time to time I have read in your interesting paper letters from correspondents dealing with the wastage of petrol that goes on in the A.S.C. and other branches of the Service. I myself had occasion to witness an incident of wilful wastage of the "precious spirit" which will no doubt be of interest to you.

A few days ago an Army biplane had a breakdown, and mechanics were sent down to put a new engine into it. When they had finished, instead of wiping their hands on a rag, one of them took a can of petrol, held it between his legs, undid the stopper, and washed his hands and arms in the petrol as it gushed out, just as if it had been water from a tap! Some of the other mechanics then did the same. Meanwhile the driver who had brought down the spare engine was giving the bodywork of his transport a wash down with petrol from another can. It was then found necessary to make some adjustment to the carburettor of the aeroplane, part of which was taken out and adjusted. Meanwhile—I should say for at least ten minutes—petrol was running out on to the ground in a steady stream, none of the mechanics thinking of turning it off.

I am a schoolboy, and own a 2½ h.p. Douglas, which I use to go backwards and forwards to school on, instead of using a train. At the most I use no more than ten to twenty gallons of petrol per year. D. G. TREGELLES.

# Stewart

## SPEEDOMETER

—the one reliable means of checking running costs.

The chief use of a Speedometer is to indicate the speed. This the Stewart does with unfailing accuracy. There isn't another Speedometer made that is so dependable. You may be quite sure that what you read on the Stewart dial — and you have only to give a glance to ascertain the speed — is absolutely correct. But the Stewart serves other purposes than indicating speed. It gives the season mileage — a record interesting in itself and valuable for checking upkeep expenses — tyre wear, petrol consumption, and the like. So that to have a Stewart on your motor cycle is not only to increase your pleasure, but to have a very essential aid to economy.

MOTOR CYCLE MODEL.

# 63/-

Registers from Zero to 75 m.p.h. Season Mileage 10,000 and repeating. Trip recorder 100 and repeating. Will fit either side of front wheel, or back wheel fitting supplied at no extra cost.

## QUESTIONS

## REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

**Magneto Chain Adjustment.**

**Q.** I have a 1913  $3\frac{1}{2}$  h.p. Triumph motor cycle. A very annoying noise has developed, which is, I think, due to the rattling of the magneto driving chain in its case. It is especially noticeable at speeds of 30 m.p.h. or over. Will you please inform me if there is any way of tightening this chain?—B.B.

Yes; you undo the holding-down bolts of the magneto and slide it on its base. You will find that these pass through elongated holes.

**Another Argument.**

**Q.** Some of my friends contend that, given a motor engine running at, say, 1,000 r.p.m., and giving, say, 10 m.p.h., it will, if the spark be advanced to give 1,500 r.p.m. (the throttle not being touched), increase the speed to 15 m.p.h. and so on, the speed increasing in exact proportion to the engine revolutions. In theory this may be so, but in practice I think the two do not keep in proportion.—AMATEUR V.

The road speed varies with the engine speed, of course, on the same gear, provided that no slipping takes place in the transmission or between the tyres and the road, and this should not occur at the speeds you name, though it undoubtedly does occur at racing speeds.

**Spark Timing too Early.**

**Q.** I have recently purchased a 4 h.p. 1911 single-cylinder and side-car. This is my first machine, and I am, consequently, quite a novice. The combination runs exceedingly well, with plenty of power. The only trouble I have is knocking. This happens when going slowly on top gear such as when turning corners and also when I change from low gear to top (N.S.U. gear). If I retard the spark the knocking at once stops; in fact, I find the machine runs much better with the spark almost fully retarded. Has a retarded spark a bad effect on the engine? I believe the engine is quite clean, as I had it overhauled after I purchased it, and have since done only about 300 miles. The knocking also stops if I cut down the air a little. The free engine on the N.S.U. gear (which is quite new) does not seem any too free. Will this improve as it gets used?—F.J.N.

It entirely depends upon how the engine is timed, but, from the symptoms, we should say that the spark is timed too early. It should be timed in the follow-

ing manner: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break, and the ignition lever two-thirds retarded. This will mean that the explosion when the ignition is fully retarded will take place when the piston has travelled about 1.5 mm. down the firing stroke. You should check this, and if you find the timing is in advance of this setting it would be advisable to retune the magneto. If the engine is as far advanced as it appears to be, no harm will ensue through driving with a retarded, or partially retarded, spark; but, of course, if the machine were normally driven on a retarded spark it would cause overheating and an increase in carbon deposit owing to incomplete combustion. We think that the clutch will free after a little further use. It is

necessary to see that the gear is adequately lubricated.

**An Inefficient Horn.**

**Q.** I have a French three-note motor cycle horn. Whilst away touring the notes refused to sound on compression of the bulb, and the air seemed to blow back. I have recently taken the horn to pieces, and on assembling it again I can only get one note to sound. Will you please suggest the cause and remedy?—W.F.D.

Remove the reeds from the horn and blow through them. Also slip a piece of thin paper between the tongue and the other portion of the reed. This should clear away all dust, and the horn should then sound. These horns are very easily choked by dust.

FIRST APPEARANCE OF THE TWO-STROKE INDIAN LIGHTWEIGHT IN A BRITISH TRIAL. (See our last issue.)

C. B. Franklin leaving Newathbridge in the Dublin and District M.C.C. twenty-four hours trial. The Franklin-Indian combination did remarkably well, as usual.

**A Magneto Failure.**

**?** I had my machine down last winter, and since then I have been unable to make it go. The engine is perfectly timed. I have had a new Lodge three-point plug fitted, and had the carburetter overhauled by the makers. When I take the plug out to see if it sparks on the top of the cylinder nothing happens, but a decent shock can be got by holding the terminal and just walking the machine. When I take off the magneto, place it on wood and the plug on a dry brick floor, I can get a splendid spark, not only at the points but all over the plug, by turning the magneto round slowly; but when I place both magneto and plug on cast iron nothing happens. I may say I run the motor cycle fairly fast when trying to start down a decent hill. I do not think there are any leaks in the induction pipe.—GREEN HORN.

The magneto seems to be in quite good order, and we should therefore imagine that the trouble is due to a defect in the high-tension wire. The magneto should spark when standing on cast iron. Of course, when you lay the plug on the iron you must be sure that only the body is in contact. If the terminal were touching you would get no spark. We cannot understand why the plug should spark when the magneto was insulated, as the current must pass from the plug body to "earth," i.e., the frame of the magneto.

**Hiring Motor Cycles.**

In response to enquiries we often receive from readers desirous of hiring motor cycles, we may state that a Manchester firm undertaking this class of work is the Manchester Motor Cycle Hire Co., of 194, Oxford Road.

**A Rebellion Souvenir.**

Under the title "Dublin after the Six Days' Insurrection," Messrs. McCreedy, Percy, and Co., Ltd., 11, Findlater Place, Dublin, have issued a picture souvenir of the Sinn Fein rebellion, containing thirty-one camera pictures by Mr. T. W. Murphy. The pictures bring home to one the scenes of devastation that presented themselves when the suppression of the rising was accomplished. The booklet is published at 8d. post free.

**To Minimise Puncture Troubles.**

A correspondent strongly recommends "Puncture" (obtainable at Halford Cycle Stores) for use in porous inner tubes and as a cure for punctures. He has used this specific with great satisfaction for some time, and finds that it heals all small punctures, makes the use of an inflator very seldom necessary, does not interfere with the repair of large cuts, and has no bad effect upon the patches.

**A Good Record.**

H. E. Newcombe, a Cirencester owner of a 1914 model  $2\frac{1}{2}$  h.p. three-speed Jap-Wolf, writes that he recently made a clean ascent of Nailsworth Ladder, and that he also brought a passenger on the carrier up Birdlip. The machine has covered 7,500 miles, and the only renewals to the engine, we are told, have been valve springs and a new big end bush. On long runs the petrol consumption is about 140 m.p.g.

B26

**READER'S REPLY.****Fitting a Magneto Switch.**

In your issue of June 22nd there is a letter asking whether the fitting of a magneto cut-out does any harm to the magneto. I have owned three motor cycles, and on my first—a  $3\frac{1}{2}$  h.p. single-speed B.S.A.—I fitted a magneto switch, with the result that, not the magneto, but the engine, especially the big end, was very badly worn. When a machine is doing about 2,000 r.p.m. the sudden shutting off of the throttle, which takes, say, about a third of a second, will allow ten revolutions of the flywheel, that is five explosions, to slow the machine, but the magneto cut-out shuts off the engine instantaneously, thus causing great strain on the bearings. I think this may be of interest to some of your readers.—CONSTANT RIDER.

**RECOMMENDED ROUTES.****GREAT MISSENDEN TO HORLEY.—M.O.W.**

Great Missenden, Amersham, Uxbridge, Staines, Weybridge, Cobham, Leatherhead, Dorking, Reigate, Horley. Approximately 55 miles.

**BALDOCK TO CHELTENHAM.—R.E.I.**

Baldock, Hitchin, Luton, Dunstable, Tring, Aylesbury, Thame, Wheatley, Oxford, Witney, Northleach, Andoversford, Cheltenham. Approximately 103 miles.

**GLOUCESTER TO WORTHING.—C.D.**

**CHICHESTER TO OXFORD.—H.L.A.**

Chichester, Petersfield, Alton, Basingstoke, Aldermaston, across the Bath Road, Pangbourne, Streatley, Wallingford, Dorchester, Oxford. Approximately 80 miles.

**STAFFORD TO PENZANCE.—W.G.**

Stafford, Penkridge, Wolverhampton, Kidderminster, Worcester, Gloucester, Stroud, Nailsworth, Bath, Chewton Mendip, Wells, Glastonbury, Durston, Taunton, Exeter, Moretonhampstead, Two Bridges, Tavistock, Callington, Liskeard, Lostwithiel, St. Austell, Probus, Truro, Redruth, Camborne, Penzance. Approximately 290 miles.

**FOLKESTONE TO BATH.—L.J.B.**

Folkestone, Shorncliffe, Hythe, Ashford, Charing, Maidstone, Wrotham, Heath, Ightham, Riverhead, Westerham, Limpsfield, Godstone, Redhill, Reigate, Dorking, Shere, Guildford, Farnham, Odiham, Basingstoke, Whitechurch, Andover, Ludgershall, Upavon, Rushall, Devizes, Melksham, Box, Bath. Approximately 165 miles.

18in. x 2in., and 18in. x  $2\frac{1}{2}$ in. The cost is 2s. for the smaller size, other sizes being proportionately more.

**Catalogues Received.**

We are in receipt of the latest catalogue of the Royal Ruby heavyweight motor cycles. It is a fine production, incorporating as it does numerous illustrations of the many interesting features which this machine possesses. It shows, for example, the adjustment of the footrests; the rear mudguard and carrier, which form a single unit, and on one of the horizontal stays of the carrier the pump is carried; the gear box bracket; the thief-proof device, which prevents the stand from being lowered when in position by means of a padlock; and the interconnected control of the clutch. Both the single and twin-cylinder machines of 5 h.p., 6 h.p., and 8 h.p., and sidecars also, are incorporated in this catalogue.

J.A.P. Motors. J. A. Prestwich and Co., Ltd., Northumberland Park, Tottenham, N. We have received a booklet of the  $2\frac{1}{2}$  h.p. J.A.P. engine, which deals with the subject in a particularly clear and lucid manner, the author being himself a practical rider as well as a highly qualified designer. The fullest possible information concerning this efficient little engine is given, and an illustration shows the name of every visible working part, which is, of course, invaluable to the novice. It is further illustrated by means of a sketch showing the interior parts. The trade man also is not forgotten, as mechanical drawings are to be found of the engine, giving the principal dimensions, so as to enable it to be built up into various frames, and also the size of the pulley side bearings and spindles, whether for chain or belt transmission.

**Petrol Substitutes.**

The demand for petrol substitutes continues, and we are told that one firm alone—Kemp's Vulcanising Co., Ltd., of Hardman Street, Manchester—have supplied more than a thousand barrels, each containing forty-two gallons of their "Kempol" fuel within the last few weeks.

**The John Bull Compound Patch Strip.**

Most motor cyclists have found the need for a long patch at some time or another, and probably it has been necessary to fix up a temporary repair with several smaller patches lapped over each other. With the object of obviating this trouble, the Leicester Rubber Co., Ltd., makers of the John Bull specialities, have introduced an 18in. band or strip of good red rubber, bevelled at the edges and prepared similarly to an ordinary patch.

With this the rider has the advantage of being able to cut off any length of patch to suit his requirements. It is made in three widths, viz., 18in. x  $1\frac{1}{2}$ in.,

The John Bull patch strip.

You can't  
drive a

Dept. B/G,  
BIRMINGHAM.

In answering these advertisements it is desirable to mention "The Motor Cycle."

# Judge by Results

**T**HE superiority of "The Motor Cycle" as a medium for small advertisements of Second-hand Machines, etc., is very clearly demonstrated by the unsolicited testimony given below, which is typical of the correspondence we receive.

## Never Had so Many Answers.

Re your letter of the 4th inst. I thank you for same, but have to inform you that the article is sold. All the articles I advertised were sold the same week, and I have never had so many answers to an advertisement before. I am still having answers, and have to return the money in some cases.

*S. Hover, 208, Merton Road,  
Wandsworth, S.W.*

## Over 100 Replies Weekly.

Re Armstrong Parts advertisement. It says much for the way that "The Motor Cycle" readers study your columns, for we are pleased to be able to inform you that we have had weekly over one hundred replies to our advertisement, the majority of which we are able to supply by return with the parts they want.

*County Cycle & Engineering Co.,  
24, Staines Rd., Hounslow.*

## Twenty-four Enquiries.

The last time I advertised in your paper was a few weeks ago. It was a machine belonging to my brother. I had about twenty letters and four telegrams in reply, and sold the machine to one of the applicants.

*R.J.H., Kettering.*

## Some Real Good Offers.

Last week I advertised in "The Motor Cycle" for a 1915 combination. I thought I should manage to get suited by so doing. I should like you to know the result.

I received over fifty letters, besides several postcards, and some were real good offers. Needless to say, I was very soon suited.

*G. J. McKay, 183, Battersea Park  
Road, London, S.W.*

## Twenty-one Replies.

I had ten replies to my advertisement in your paper of a 1914 Triumph and sidecar, also five offers of exchange and four callers and two wires.

*R. F. Meredith, Bedford.*

## Plenty of Applications.

Mr. ——— was the first to answer my advertisement, and he wanted to know if I was willing to send on cover if he deposited money with you, and I agreed. I had about twenty other applications, some of whom sent on cash.

*F. A. Vallis, Somerset Rd., Frome.*

## Swamped out with Replies.

Please, oh please, stop my advertisement. Simply swamped out with callers, letters, and postcards. Many pounds returned.

The above are absolute facts. Sold the same day as advertised.

*W. Winward, 342, Gt. Clowes St.,  
Higher Broughton, Manchester.*

## A Satisfied Buyer Every Time.

We might say we have had several advertisements with you now, as you know, and each time we have met with a satisfied client.

*Clark & Son, Motor Engineers,  
Long Melford.*

## Sold in Half an Hour.

Will you please insert the overleaf advertisement in your excellent paper "The Motor Cycle," of which I am a regular subscriber. I thought I would just tell you I inserted an advertisement a little while ago re L.M.C. After appearing in your issue I received a telegram, and upon taking machine in reply I sold it within half an hour to a very satisfied customer.

*C. Jennings, Barum House,  
Sampford Peverill, Tiverton.*

of the

## RICH DETACHABLE Tubes & Covers

4,500 miles on a RICH Tube without using the pump. This absolutely unsolicited testimonial can be seen with a thousand others, at our office; also hundreds of ends of all other makes—British and Foreign—with the opinion of the riders.

## Testimonial.

Gentlemen, Highgate. Please send me a Rich Tube. I must mention the one I tried and have in use since 1911 is still acting splendidly, and I am now transferring the present one to the front, and fitting a new one to the back. They are a boon.

## RELIABILITY.

"I have now just completed 10,000 MILES IN TWELVE MONTHS. I am still using the same chains and sprockets." (Rider's initials) Rev. R.C.O.

VELOCE, LIMITED, BIRMINGHAM.

In answering these advertisements it is desirable to mention "The Motor Cycle."

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application. Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **Iliffe & Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

ROVER, 1915, T.T. model, fitted with Phillips's Grade Multi pulley, handsome machine, all accessories, complete; 40 gns.—Vauchope's, 9, Shoe Lane, London. [7758]

ROVER, 1916, 3½ h.p., 3-speed countershaft gear; delivery from stock, with coach sidecar, £84/7; exchanges or extended terms.—Elee and Co., 151-16, Bishopsgate Av., Cannonville St., E.C. [0552]

ROVER, 1914, 3½ h.p., 3 speeds, free engine, and Supreme coachbuilt sidecar (as new), perfect order and condition, tyres nearly new; been very carefully used, complete with lamps, horn, etc.; £48/10, bargain.—Elt, Sharnbles, Worcester. [X3146]

## Royal Ruby.

ROYAL Ruby, 2½ h.p., 2-stroke, 1915, £18, or nearest offer.—Miller, Ermelo, Clarence Rd., Fleet, Hants. [X3246]

ROYAL Ruby, 2½ h.p., 2-speed, equipped; cost £42 January, 1916, bargain. 28 gns.—Walls, Outfitter, Dartmouth. [7837]

## Rudge.

RUDGE Multi, 1914, almost new, speedometer; £35.—Warren's, 6, Warren St., London. [7817]

19 12 3½ h.p. Rudge, free engine, good condition; £25.—R. E. Jones (Garages), Ltd., Swansea. [0785]

3½ h.p. T.T. Isle of Man Rudge Multi, fast machine, £32 fitted with all accessories; £55.—Wauchope's, 9, Shoe Lane, London. [7762]

RUDGE Multi and sidecar, late 1914, in perfect condition; any trial; £38.—Kelly, 22, Bushey Rd., Harlington, Middlesex. [7601]

3½ h.p. Rudge Multi, one month old, not done 500 miles; £50; with coachbuilt sidecar £55.—Titt, Westminster Rd., Coventry. [X3284]

RUDGE and Sidecar, 2-speed gear, in first-class condition; price £30, or offer.—Address, 1, Belvoir Terrace, Saeleton, Nottingham. [X3045]

19 15 Rudge Multi, 3½ h.p., delivered August, done 600 miles, Millers' lamp and horn complete, unpunctured; nearest £46.—The Garage, Whitland, S. Wales. [7753]

19 14 3½ h.p. Rudge Multi, C.B. Mills-Fulford sidecar, splendid order, complete accessories; £40; seen and tried by appointment.—H., 304, Eglis Av., London, W. [7588]

LATE 1915 5-6 h.p. Rudge Multi, complete with Rudge coachbuilt sidecar, hood, wind screen, speedometer, horn, and lamps, grand condition, mileage 2,000; £55; part exchange cycle car.—Gayford, 205, Anerley Rd., Anerley. [7853]

RUDGE Multi, 1913, fitted 1915 cylinder and piston, with sporting cane sidecar, perfect order, speedometer, lamps, horn, and spares, complete; £37/10; by appointment only.—Lieut. Williams, Stratford Lodge, Otlands Park, Weybridge. [7644]

## Scott.

COLMORE Depots, Birmingham and Manchester, for Scott motor cycles. [0806]

SCOTT Canoelet Combination, in splendid condition; £32/10 a bargain.—Shilcock, 100, High Rd., New Southgate, N. [X2882]

## MOTOR CYCLES FOR SALE.

## Scott.

1914 Scott Combination, aluminium torpedo body, one of the smartest turnouts on the road; 44 gns.; would separate.—Allan, The Glen, North Rd., Hayes End, Middlesex. [7668]

SCOTT, 1914 model, fitted with new Mills-Fulford sidecar, complete with all accessories, runs slow and fast, a nice, superior combination; £55.—Wauchope's, 9, Shoe Lane, London. [7765]

1913 Scott and Gloria Sidecar, speedometer, full equipment, fine condition; any reasonable trial given; £35/10.—Tuke and Bell, Ltd., Motor Dept., Carlton Engineering Works, High Rd., Tottenham, N. [6660]

SCOTT Motor Cycle, completely re-built in 1915; owner gone abroad, tyres almost new, speedometer, horn, lamps, and generator, tools, etc., also sidecar; £38, complete.—Rev. G. Sumner, Earnbank, Wormit, Fifehire. [7612]

THE Plum of the Week.—3½ h.p. Scott, 2 speeds, kick-starter, Binks carburetter, 1915, drip feed, and improvements, engine, gears, etc., perfect, thoroughly overhauled cost of £3; owner abroad; £26/10, lowest; with sidecar £30 for spot cash.—London House, Dinnington, Rotherham. [X3198]

## Sparkbrook.

SPARKBROOK Lightweights in stock; £40.—Attwood's Garage, Eccleshall, Staffs. [7688]

## Sun.

SUN-V.T.S. Lightweights in stock; £31 and £37.—Attwood's Garage, Eccleshall, Staffs. [7689]

COLMORE Depots, Birmingham and Manchester, for delivery from stock of all models of Sun motor cycles. [0807]

SUN 2-strokes, 1916 models, single and 2-speeds; delivery from stock.—Jackson Wright, 10, Pudding Chare, Newcastle-on-Tyne. [6611]

1915 Sun-Villiers 2-stroke, lately overhauled, rear tyre new, U.H. horn, Sencap, footboards, horn, no lamps; £17.—T. 73, Wilton Rd., Salisbury. [X3169]

1916 Sun, 2½ h.p. V.T.S. engine, 2-stroke, 2-speed; original net price £37, not ridden 50 miles, genuinely new as list; £31/10.—Robinson's Garage, Green St., Cambridge. [7701]

SUN V.T.S., 2½ h.p., 2-stroke, late 1915, in excellent condition, good hull-chamber; reason for selling, owner requires sidecar combination; £26.—W. Matthews, Plant Farm, Flitwick, Beds. [7640]

1914 2½ h.p. Single-cyl. Sun-Precision Lightweight, free engine clutch, 26×2in. Clincher Dreadnought tyres, a reliable machine, in good condition; £17.—The Premier Motor Co., Aston Rd., Birmingham. [7871]

## Sunbeam.

SUNBEAM 3½ h.p. Models; £73/10.—Attwood's Garage, Eccleshall, Staffs. [7687]

SUNBEAM, new 1916 3½ h.p. standard model actually in stock.—Moss, Wem. [X3235]

1915 3½ h.p. Sunbeam, perfect order; 50 gns.—A. L. Pitts, Redditch. Tel.: 91. [X3290]

2½ h.p. Sunbeam, 1914 model, 2-speed gear and chain drive; £32/10.—Wauchope's, 9, Shoe Lane, London. [7763]

3½ h.p. Sunbeam, new, accessories optional; owner no time to ride.—Coates, 12, Laburnum Grove, Beeston, Notts. [X3159]

SUNBEAM, 1914, 2½ h.p., 2-speed, h.h. clutch, good condition; £35.—Smith, 39, Gloucester Rd., Finsbury Park, N. [X3058]

1914 6 h.p. Sunbeam and sporting Fitsu coachbuilt sidecar, 2 head lamps, etc., magnificent outfit, in fine condition; £69/10.—Crow Bros., Guildford. [7114]

SUNBEAM, 3½ h.p., new March, 1916, P. and H. head lamp, generator, and tail, A.K. knee-grips, electric horn, speedometer, etc., in perfect condition; owner bought car; £70.—Box 576, c/o The Motor Cycle. [X3001]

3½ h.p. Sunbeam, latest pattern, black and gold finish, with Mills-Fulford coach Skiff sidecar, apron and mat, Lucas black lamp set, Lucas rear lamp set and 1 gn. horn, ridden 100 miles only; £87.—Robinson's Garage, Green St., Cambridge. [7704]

1916 3½ h.p. Sunbeam, absolutely latest pattern, black and gold, with Lucas lamp, horn, speedometer, watch, etc., and nearly new coach Millford sidecar, the whole turnout in beautiful order, 500 miles only; £86.—Capt. Mallam, 26, Trinity St., Cambridge. [7707]

## Triumph.

3½ h.p. Triumph, 1912, splendid condition; £23.—193, High St., Tonbridge. [X3256]

3½ h.p. F.E. Triumph; £20, guaranteed.—Wauchope's, 9, Shoe Lane, London. [7768]

1911 Triumph, F.E., with accessories; £21.—Harvey, Hudson, South Woodford. [X3139]

1913 Triumph, 3-speed, tyres as new; £34.—Bull, St. Giles' Sq., Northampton. [X3283]

TRIUMPH, 1916 model, 4 h.p., countershaft, new.—Attwood's Garage, Eccleshall, Staffs. [7684]

JUNIOR Triumph, 1915, nicely equipped, and in splendid tune; £33.—Bunting, Harrow. [7840]

1915 2-stroke Triumph, splendid order; £36/10.—F. J. Bull, St. Giles' Sq., Northampton. [X3282]

## MOTOR CYCLES FOR SALE.

## Triumph.

TRIUMPH, 1910, Brampton variable gear, wicker torpedo sidecar; £21.—Toms, Catherine St., Leicester. [7739]

1914 Triumph, 4 h.p., Gloria sidecar, 3 speeds, perfect; what offers?—47, Newland Av., Hull. [X3262]

1913 3½ h.p. 3-speed Triumph and Sidecar, like new; £38.—Wilkie, Hunter's Bar, Sheffield. [X3205]

TRIUMPH, 3½ h.p., 1914, T.T. racer, perfect condition; £30, or nearest.—90, Allerton Rd., Liverpool. [X3168]

1913 3½ h.p. 2-speed Triumph and Sidecar, perfect condition; £35.—Wilkie, Hunter's Bar, Sheffield. [X3204]

1915 Triumph and Millford Sidecar, complete Lucas lamps, etc.; £58.—Cross, Evingham Sq., Rotherham. [X3225]

3-SPEED Triumph and Gloria Sidecar, splendid condition; £45.—Leighton's, opposite Wood Green Station, N. [7636]

TRIUMPH, 1909, late, new tyres; £15, or exchange lightweight.—A. C. Walker, 90a, Elsinore Rd., Forest Hill. [7679]

TRIUMPH, 1910 clutch model, good condition, £20; also 1912 clutch model, £25.—Stour Cycle Depot, Stourbridge. [X3166]

TRIUMPH Baby, 2-stroke model, 2 speeds, excellent condition; £35.—P. J. Evans, John Bright St., Birmingham. [X3183]

3-SPEED Triumph and Sidecar, 1914 model, all accessories; any trial; £47.—Harford and Co., Station Rd., Canterbury. [6988]

TRIUMPH, T.T. (1913 engine), perfect, fast, with accessories.—£26/10.—Leighton's, opposite Wood Green Station, N. [7635]

TRIUMPH and Cane Sidecar, N.S.U. 2-speed gear fitted, just overhauled; what offers?—Dent's, Stonegate, York. [7806]

1913 Triumph, 3-speed, lamps, and Lucas horn, and sidecar, in good condition; £42.—Bull, St. Giles' Sq., Northampton. [X2282a]

TRIUMPH, 1910, perfect running order; accept £15 for immediate sale.—4, New River Crescent, Palmer's Green, London. [7578]

1914 Triumph, 4 h.p., 3-speed, and coachbuilt sidecar, like new; 50 gns., or near offer.—13, Shildon Rd., Blaydon-on-Tyne. [X3197]

TRIUMPH, T.T., renovated, and new tyres; bargain, £20.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [7735]

3-SPEED Triumph and Sidecar, screen, lamps, and speedometer, spares, etc.; £40.—Leighton's, opposite Wood Green Station, N. [7637]

TRIUMPH, 1914, 3-speed, and C.B. sidecar, host of accessories and spares, first-class order, little used; £50.—Pettit, Newport Pagnell. [X2874]

1912 Triumph, free engine, Philipsons pulley, Jones speedometer, engine re-bushed last year; £28.—12, George St., Richmond, Surrey. [7695]

TRIUMPH, 3½ h.p., 3-speed Sturmer-Archer gear, with cane sidecar, lamps, etc.; first cheque £27/10.—Greenwood, Market St., Barnsley. [7848]

TRIUMPH Junior, an exceedingly fine sample, overhauled and guaranteed sound, Lucas lamp, etc.; £32/10.—Layton's Garage, Bicester, Oxon. [X3240]

TRIUMPH, 3½ h.p., 2-speed, free engine, splendid condition; first offer of £18 accepted for quick sale.—76, Summerley St., Earlsfield, S.W. [7796]

TRIUMPH, 1914, 4 h.p., 3-speed, horn, lighting set, first-rate condition and appearance; privately owned; £37.—31a, Broomfield Rd., Chelmsford. [X3270]

T.T. Triumph, 1911, 3½ h.p., thoroughly overhauled, enamelled and plated, perfect condition; £25.—Doraston, 37, Orford St., Wavertree, Liverpool. [X2361]

1914 T.T. Roadster Triumph, P. and H. set, Lucas horn, rear drive Watford, all tools, condition like new; £42.—Harvey, Hudson, South Woodford. [X3142]

3½ h.p. Triumph, 1911, free engine, in perfect condition, lamp, generator, Cowey's speedometer, all accessories; £30.—E. Maling, Blackwell Hall, Dartington. [X3110]

1914½ Triumph, 4 h.p., 3 speeds, coachbuilt sidecar, magnificent condition, not done 1,500, spares, including tyres, Badoeck's by-pass; £48.—Southwood, 4, Francis Rd., Watford. [X3079]

1913 3½ h.p. Triumph and Gloria wicker sidecar, 3-speed, thoroughly overhauled, new rims and tyres recently fitted all wheels, good condition; £40.—Daniels, Lightpill, Stroud, Glos. [7617]

1913 Triumph, 3½ h.p., 3 speeds, Sturmer-Archer gear, with coachbuilt Gloria sidecar, spring wheel, in perfect condition; 40 gns.—Proud, 9, Pemberton Gardens, Upper Holloway, N. [X3249]

TRIUMPH, 1913, and coachbuilt sidecar, 3 speeds, clutch, 3 lamps, horn, Stewart speedometer, not done 4,000 miles, runs over 80 m.p.g.; £48.—68, Shepherd's Lane, Dartford, Kent. [7692]

## Trump.

TRUMP-J.A.P., 5-6 h.p., 3-speed, Bosch watertight, and Canoelet sidecar, new tyres, speedometer, lamps, and full equipment; £30.—14, Dodbrooke Rd., West Norwood. [7888]

## The Central Office for Motor Cyclist Recruits.

SIX months ago we recorded the fact that 6,000 prospective recruits had made application to us, and had received advice to the best of our ability as to the most suitable section for them to join. Last week the total reached 10,000—quite a little army in itself. At the outset it was patent that readers of this journal, being naturally interested in things mechanical—quite apart from the thousands of readers who are skilled engineers and mechanics of all classes—were destined to play an important part in this world war, and consequently we early made it our duty, in response to continuous applications, to direct men of experience to the different specialised sections for which they were most suited.

Obviously, a skilled man in the right place is far more valuable to his country. On this point, however, it may clear the air if it is stated that a condition of enlistment being "general service," the War Office may, when exigency demands, transfer or adapt recruits to any depot or regiment, *i.e.*, a motor cyclist despatch rider may one day find himself in a line regiment with a rifle and bayonet, or a food lorry driver allotted to an armoured car. The figure of 10,000 named represents the number of individual applications we have personally handled—naturally we have no record of the thousands of readers who have made direct application to one or other of the numerous depots whose requirements have been readily announced in our pages for the benefit of readers. We may be forgiven for stating, in order to clear any misconception, that our personal efforts, as well as the page regularly devoted to recruiting matters, have been entirely without pay. Our sufficient reward is in the knowledge that this journal—essentially one appealing to the peace-loving mind—has been able to prove itself a national asset in the time of the country's need. The late Lord Kitchener, the War Office

authorities, as well as commanding officers of different motor sections, have been good enough to express their appreciation of our work.

## Two-strokes v. Four-strokes.

A SHORT time ago the relative positions of two-strokes and four-strokes were discussed on this page. As is generally recognised, there is a good deal of healthy rivalry existing between makers of these two types of engines, and we expressed the view that, instead of the rivalry decreasing as was generally supposed, due to the rapid advance of the two-stroke, the future trend of design might reasonably show that the miniature four-stroke engine was by no means eclipsed for all time. The development of the simple two-stroke, however, seemed after a while to reach a stage after which little or no progress could be discerned. Even now there are certain faults common to a two-stroke engine which are not present in the four-stroke. Our opinions of the past were based mainly on the extravagance of a two-stroke engine in the matter of petrol consumption when compared with a four-stroke. At the time the opinions were expressed, petrol was just half the price that it is now. How much stronger, therefore, is this all-important point of economy in favour of the four-stroke engine? We need not go over old ground in detail, but it is worth, perhaps, mentioning once again that in the early days tiny four-stroke engines failed by reason of their rapid deterioration. Latter-day developments, however, have produced a most efficient engine, almost everlasting valves, and an engine that will remain cool even after prolonged non-stop runs. These improvements, which were originally effected in the 500 c.c. four-stroke engine after extended racing experience, have gradually been reflected in the lightweight engine, and the present four-stroke lightweight cannot be compared with the machines on which many motor cyclists served their novitiate. The race for supremacy between the two and the four-stroke will be interesting and instructive.

## SIDECAR BODY DESIGN.

HOW THE GENERAL APPEARANCE MAY BE IMPROVED.

**T**HIS article is an attempt not only to improve upon the beauty that can with a little thought be introduced in building the body of a sidecar, but also the comfort. For instance, in fig. 1, which can be specified as a family sidecar, the lines lend to the body a sense of floating lightness only to be seen in a yacht that has been dry docked. The judicious handling of colour (in this model, black, grey, and silver) lends a certain distinction and originality that

Fig. 1.—A yacht-shaped family sidecar.

pleases, as it is out of the ordinary. On most sidecars too little attention is paid to the design of the hood. Nothing can so upset an otherwise attractive design than a cumbersome and ill-shaped hood. The hood illustrated looks as if it were part and parcel of the design, and this is as it should be.

Leaving the beauty part of the design for a moment, let us consider the comfort. The principle followed is streamline, but with this difference: the stern of the car is upswept and flat, thereby effectually preventing the clouds of dust from settling in the fair occupant's hair. The seating accommodation is larger than that of most sidecars, and, necessarily, the sidecar itself is wider, but this width is hidden in the rounded shape. The seating is built upon the same proportions as an ordinary armchair, and to sit in it is a revelation after many sidecars, which often seem to us to be too narrow.

The locker-under-the-seat idea is done away with in this design, the whole of this space being taken up with canvas webbing and coil springs, as in armchair practice. It makes running over pot-holes no account as far as the passenger is concerned.

Fig. 2.—A doctor's coupé.

The locker is situated in the flat stern, with access to it through a hatch-shaped cover. A child's seat is hinged to the off-side of the body, which lets down as shown in the illustration, the width of the

body giving plenty of room for both occupants; beside which the windscreen is movable forward and the front deck of the sidecar lets down, so as to give greater length when required. The upholstery is in grey with a nickel beading. The hood is of a dark grey colour, held by black supports with nickel fittings, the same fittings being on the sidecar.

### Suitable for a Doctor.

Fig. 2 is a doctor's sidecar, and has been designed on an economy basis. It is an undoubted fact that a sidecar outfit can be run very much more cheaply than any car, and a coupé sidecar well designed will just about suit the doctor who now finds his car too expensive a method of propulsion.

The car is designed on the same comfortable lines as No. 1, the enhanced comfort of the springing taking away all fears of upsetting a doctor's hand for a delicate case or for operations. In the sketch can be seen the dashboard of a sidecar containing an appointment card, a watch, and a speedometer, the speedometer in all the models illustrated being fitted to the sidecar wheel, and placed so as to be easily read from both the motor cycle and also the sidecar.

The locker is lined with plush or some other suitable material, and is behind the dashboard, the drive of the speedometer being so arranged that on closing the locker door the drive is connected automatically to the dial. The

Fig. 3.—The Harley-Davidson body. Plan on the left and section on the right.

small sketch shows how this can be done. The locker is large and roomy enough to contain all that a doctor requires, and, being placed in the front of the body, is well away from all dust. This model, of course, would be also suitable for a lady.

### A Harley-Davidson Model.

Fig. 3 is a sidecar designed especially by the writer for the Harley-Davidson Co. It is well known that beauty in sidecar design is either a perfect match between sidecar and machine or in a charming contrast. In this model we have decided on a match. The whole body is designed after the manner of the Harley-Davidson tank, the sides being curves as well as the upper and lower portions. The same roomy comfort is found in this model, and the arm rests are recessed as in the sectional sketch. The hood is in keeping with the general design, the colour scheme being Harley-Davidson grey, black mudguard and disc, together with nickel fittings.

The first of these sidecars is now being built, and is intended for Sir Hugo de Bathe, an enthusiastic sidecarist.

H.M.

Occasional  
Comments**Even Oiling on Flat Twins.**

I have received a variety of letters dealing with the relative lubrication of front and back cylinders on horizontally opposed twins. A Douglas enthusiast writes from France to say that, when his machine was new, the oiling was certainly very unequal, but, on taking his engine down for the first time, he discovered that the paper cylinder washer had shifted during the tightening of the bolts by the assembler, and that it covered the oil hole designed to convey an additional supply to the skirt of the front piston. In making his new washer, he cut a much larger hole in the washer, and has since enjoyed even oiling. Other riders of horizontal twins support my contention that few engines of this type (and of the V type) distribute the oil fairly.

**Multi-cylinder Oiling and Two-strokes.**

I expect the difficulty of assuring even lubrication is one of the factors which has delayed the development of two-stroke twins. Those of us who have wrestled with the four-stroking problem on more engines than one will realise that a two-stroke twin with a tendency to over oil one cylinder would be a holy terror. Imagine a twin which is two-stroking regularly on one cylinder and four-stroking on the other! Certain factory testers must have spent some humorous and tragic hours wrestling with such conditions; but they can be dealt with, and two-stroke practice should then react on four-stroke practice, and uneven oiling become a bad dream of bygone days.

**Rigid and Flexible Drives.**

Increasing experience has led me to modify my old opinions on the three commoner types of transmission. Taking the average of all the machines I know, I should still say that nothing is quite so uniformly sweet as the direct belt drive; but that, allowing for wet weather, sidecar work, and the tendency of evolution in variable gears, the chain-cum-belt drive is obviously superior. I would even go further, and add that I think the chain may ultimately oust the chain-cum-belt. A badly designed chain drive on either a single-cylinder or a V twin can still cause the maximum amount of vibration and trouble; and inferior chain drives are far commoner than they ought to be. There are still many machines which have crude cushioning devices, awkward or unreliable adjustments, and chain cases fit only for the scrap heap. There are also a strictly limited number of machines equipped with such perfect chain drives that the keenest belt enthusiast need have no hesitation in buying such a mount. The first essential is a first-class engine. In addition to such an engine, the machine really requires two separate cushioning devices, one for the fore chain, and one for

the rear; and a few of the spring drives on the market effect their object so efficiently that it is really difficult to mark any harshness in the drive, even when one cylinder is missing, or pulling in a weak and half-hearted fashion.

**Naked or Uncased Chains.**

Very possibly the battle between the chain-cum-belt and the two-chain drive may be fought out on the point of encasing the rear chain satisfactorily. It is an easy matter to enclose the fore chain in a neat, rattleless, and get-at-able casing of cast aluminium; the back chain is the real problem. Its case is almost bound to spoil the appearance of the machine, though appearance is a minor point. It is a very thorny problem to manufacture a light, accessible, and rattleproof rear chain case, especially when the necessity of back wheel withdrawals and chain adjustments are taken into consideration. Many makers have abandoned experiments in favour of a mere chain guard which is really quite efficient. Then the rear chain must be readjusted whenever the comparatively quick wearing front chain needs resetting, whereas the rear belt seldom needs tightening when the gear box is shifted back a trifle. I must say that the chain-cum-belt drive is the better of the two for the time being, in my opinion; but I dare not prophesy as confidently as once I did that it is the ultimate survivor. We have still to reckon with the shaft drive. If the once harsh chain drive can be smoothed down till it is tolerable on a single-cylinder, and—at its best—delicious on a horizontal twin, we must not assume too readily that the shaft can only make good on four cylinders.

**Long-stroke Engines.**

Mr. Norton claims that reduction of pressure on the bushes, and consequent slowness of wear, is a great merit of the long-stroke engines so particularly connected with his name in the motor cycling world. Will some leading designer of short-stroke engines please weigh in with a letter explaining why the bulk of our designers plump for the "square" type of engine? We can hardly expect Mr. Norton to state the arguments which weigh against his choice; and quite a number of our readers are wondering why so pleasant a design as the Norton is comparatively uncommon. I wonder if it is remarkably difficult to obtain the Norton quality of balance on a long-stroke single-cylinder? Not long ago a firm lent me a long-stroke single which it was intending to launch with a great flourish of trumpets, but it was ultimately withdrawn, by no means to my surprise; it developed an astounding kick, but the vibration at nearly all engine speeds was the veritable limit.

## A SPECIAL 8 h.p. CAMPION.

8 h.p. J.A.P. Engine, Sturmey-Archer Three-speed Countershaft Gear, Chain Transmission.

**T**HE CAMPION CYCLE CO., of Nottingham, has just produced a special 8 h.p. J.A.P.-engined sidecar mount, which possesses many points of real interest. In general design it is precisely the same as the 1916 model, which we described in our issue of November 4th last (page 442), the departures being mainly in connection with the fittings.

First of all the engine is one of the latest 8 h.p. J.A.P.'s, having exhaust valve caps with cooling fins, whilst it also has the new lubrication system adopted by Messrs. J. A. Prestwich and Co. The gear is a Sturmey-Archer countershaft three-speed type adapted to all-chain

room for an adult passenger in addition. The rear portion is hinged, and inside the compartment a tin of petrol, oil, tools, and a small amount of luggage may be carried, and so overcoming the usual trouble of cramping the passenger.

Sturmey-Archer gear with chain and chain-cum-belt transmission, should particularly appeal to the Overseas rider. Though in general design the Overseas model is a duplicate of the British model a different type of frame, giving an extra 1½ in. ground clearance, is used. The tyres are 650 x 65 mm. On the latest products an internal expanding band brake is used at the rear, and a rim brake on the front wheel.

A number of machines of this type were shipped to Denmark a few weeks ago, but in this case the Licensing Committee of the Board of Trade stipulated, as usual, that the machines should be despatched minus tyres.

Latest model 8 h.p. Campion passenger outfit. The engine is a J.A.P., the gear a three-speed countershaft Sturmey-Archer, and the drive is by chain throughout. A good sidecar is fitted with a capacious back compartment.

drive, the front chain being enclosed in an aluminium case, and the rear one protected on its upper edge. The carburettor fitted is an Amac, on which is provided a pipe and tap in the induction pipe taking hot air direct from the front cylinder. The owner of this special machine finds that this results in a saving of fuel, and estimates that an extra speed of five miles per hour is obtainable. The substantial width of the mudguards will be noted. They are all 8 in. wide, with side extensions to the front guard, whilst the sidecar guard has an inside covering practically enclosing half the wheel, and so preventing any splashes of mud reaching the sidecar. The back mudguard and carrier are hinged, and may be quickly removed for ease of repair in the case of a puncture. Tyre troubles, however, should be practically non-existent, seeing that in this particular machine 700 x 80 mm. Dunlop car tyres are fitted. Mark II. pattern-Druid heavy forks absorb the road shocks.

The sidecar, it will be agreed, is of very taking appearance. It has a small seat in front for a child, and gives ample

The Campion illustrated represents the first occasion upon which all-chain drive has been applied to a Sturmey-Archer gear. A shock absorbing device is fitted in the back hub, although on the standard Campion this is dispensed with. After eight hundred miles of road testing the owner of the mount illustrated is delighted with its performances.

The latest radiated valve cap of the J.A.P. engine.

### The Overseas Model.

Whilst at the Campion Works we were able to inspect part of a batch of machines to fulfil an order from Dunedin, New Zealand.

These machines are bound to create a good impression on account of their solid construction and absence of fittings, which have not proved themselves in constant road usage. The 8 h.p. J.A.P.-engined model, fitted with a

### MORE SUNSHINE FOR WOUNDED SOLDIERS.

**W**HAT has become known, from preliminary notices, as the Thornton Heath sidecar outing for wounded soldiers took place on Wednesday of last week. The run was favoured with glorious weather with the exception of a passing thunderstorm, and the men thoroughly enjoyed themselves.

The leading light in the enterprise was Mr. Alfred Taylor, of Thornton Heath, and he was assisted by a large number of sidecarists, the total number of machines present being fifty-two. Of these, twenty-seven were Enfields, and there were two ladies among the drivers. The men were taken from the Crescent Hospital, Croydon, and the destination was the Leith Hill Hotel, where tea was served in the garden. Each driver paid for his passenger's tea, and the Enfield Cycle Co. presented each man with a box of cigarettes.

Photographs taken at different stages of the run will be found in this issue.

## CLOTHING AND CLEANLINESS.

### How the Use of a Motor Cycle can be Extended.

IT has always been the aim of this journal to foster development in motor cycle design to the fullest extent. Since the introduction of the practicable mount we have endeavoured to develop to the best of our ability every item which promised real progress in design. So far development has resulted in perfect reliability; in the future, therefore, attention has to be given to refinements. First must come cleanliness, and then comfort; better still, both should be evolved together. Now that so few machines are being made, designers should consider how best to add refinements to their productions, and then incorporate them as soon as they are ready for manufacture. Up to the present cleanliness has been studied only from the point of view of keeping the rider's garments free from mud, and the Great War, which is turning out to be the greatest reliability trial ever held, will render the post-war models of the W.D. pattern better than ever in this respect. Mud that clogs bearings and working parts must be excluded, so the result is that not only the machines but the rider as well are protected. It does not matter if oil flies about, as the D.R. need not be too particular about his overalls, but if oil gets on the clothes of the private owner, he is, or ought to be, considerably annoyed. The idea that one cannot ride a motor bicycle without getting filthy has, unfortunately, some foundation. It is a most important matter, and needs the most careful attention.

If the motor bicycle is to become even more popular than it is at present, it must be a cleaner machine than it is now. The engine is

With present-day mud-guarding, motor cyclists are obliged to present the appearance depicted above, even in fine weather.

necessarily exposed, and any oil which it exudes may be caught by the rider's clothes. Dust and mud can be brushed off, but oil cannot be cleaned by petrol from mackintoshes without destroying their waterproof qualities.

### The Importance of Cleanliness.

Now what we want to aim at is freedom from oil, which is not an easy matter when the engine is always, and the transmission usually, in an exposed position. To add to these difficulties, a motor cycle engine—sometimes unkindly but quite accurately called an oil-cooled motor—is always thirsty for lubricant. Oil will therefore leak from crank case and timing gear case joints, tappet guides, and release valves, while it is flung in all directions by exposed chains. Next we have the lubrication systems to consider. The petroil system so prevalent on two-strokes is mechanically good and delightfully simple, but deserving of the strongest censure on account of its extreme messiness. Fuel can never be taken aboard unless oil is taken in at the same time.

And no one can draw oil out of a slow dripping tap, measure it off, and pour it into the tank without getting his hands or his gloves dirty. The "mixture" exudes from the filler cap and the carburetter. From the top of the tank it runs down the sides just where the rider grips with his knees. If he be wise and wear a long coat the front of this gets into a horrible condition as the petrol part of the mixture rapidly evaporates and the oil is left behind. Drops of the golden fluid fly off the carburetter and alight on his trouser overalls, and after a hundred miles he is not

Thus attired one should be able to ride a motor cycle in summer weather.

A machine should be so guarded that tennis or cricket players can ride to the grounds if they are five or twenty miles away from home.

fit to be seen. The system, therefore, can hardly appeal to anyone who takes any pride in his personal appearance. The drip system to the inlet pipe in

two-stroke engines and in four strokes oil-tight tappet guides, perfect crank case joints, and adequate relief valve exits, are the solutions, while doubtless considerable improvement could be obtained by the adoption of a mechanical lubrication system which guarantees direct delivery of oil to all moving parts, without an excess of lubricant in the crank case, and naturally the transmission should be enclosed.

Now it should be perfectly possible for a man to ride a motor bicycle in the height of summer for a considerable distance without overalls, and it should also be possible to ride in flannels to the river, the tennis court, or the cricket ground, but few machines even of 1916 pattern will allow this to be done. The rendering of an engine practically oiltight can be accomplished, but all that can be done at the present time is to keep the speed down and use as little oil as possible if one desires to keep particularly clean on a short run. When times are again normal and trials are held once more the Auto Cycle Union, at the end of the next six days trial, should arrange for the machines to finish up at Brooklands, undergo a short speed test, then see that the riders are garbed in clean holland overalls, set a minimum speed of thirty miles an hour, send them round the track for, say, ten laps, and give a prize to the cleanest man and machine at the end of the test.

## The Increasing Output of British-made Magnetos.

IT is extremely gratifying to see how the British magneto industry has taken advantage of the demand for British magnetos which has been caused by the war stopping supplies from foreign sources. It has always been a source of dissatisfaction to the patriotic Britisher to have his favourite mount decorated with a foreign magneto. Now, however, we are pleased to see there is no need for this state of affairs to exist, for we have a large number of British-made magnetos, equal in every respect, and in many ways superior, to the German-made article of pre-war days. Not only have we ample supplies for home use, but the outputs are now so large that we look forward in the future to see England one of the chief exporting centres for magnetos, instead of, as of old, importing practically every machine used.

The Electric Ignition Co., Ltd., of Birmingham, were one of the first firms to realise this demand, and have, by perfected organisation and the concentration of their energies on one model, succeeded in producing one of the finest instruments ever manufactured, in addition to having probably one of the largest outputs of British-made magnetos.

Although the company wish it to be understood that they have no intention of placing any additional models on the market until more settled times arrive, we are given to understand that they are experimenting with many new models, and have already produced a two-cylinder

motor cycle magneto which on test has proved most satisfactory.

The single-cylinder model at present made is constructed on sound and well-proved lines, all the parts being very strong and substantial.

The accompanying illustrations show how easy it is to adjust the platinum contacts. Having removed the central holding down screw with the small spanner supplied and taken off the contact breaker, first loosen the screws A and B (fig. 1), next turn on one side the spring clip C (fig. 2), when the rocker arm can be lifted carefully off its bearing (as shown in fig. 3) with the fingers. Then when exposed (as in fig. 4) the points can be cleaned and trimmed up with a small file. The adjustment should be carried out when the contact breaker has been replaced.

We have received an extremely neat booklet of instructions on the care and management of the E.I.C. magneto. This contains many most useful hints and tips, in addition to a guarantee for one year for any E.I.C. magneto against faulty workmanship or material. It is most interesting to note that this guarantee is retrospective, and covers practically every magneto the firm have manufactured. Owing to their increasing export business, they have found it desirable to have this booklet also printed in Russian.

FIG. 2.

FIG. 3.

FIG. 4.

Removal of rocker arm from contact breaker.

## Electric Lighting for Lightweights.

### The Claims of the Storage Battery System.

**A**FTER the war there will be a great rush for electrically illuminated motor cycles. As it is, many of the few 1916 British-built sidecar outfits are equipped with dynamo lighting sets, and it has already been mentioned in *The Motor Cycle* that some firms with spare moments on hand in the making of munitions are adapting this form of lighting for solo machines. At the same time, the claims of the simple storage battery lighting system for certain types of machines and certain classes of work must not be overlooked. It is cheaper, less weighty, and simpler than a dynamo set, and hence it is eminently suited for lightweights. For a man who uses his machine, whatever its power, for running

a few miles into town from the country and back again every evening, a set such as the following is all that is necessary.

A 2½ h.p. two-stroke Coventry Excelsior machine fitted with storage battery electric lighting.

Electric lighting direct from storage battery, as fitted to a 2½ h.p. two-stroke Excelsior.

The equipment illustrated and described herewith is one standardised, after successful trial, by Bayliss, Thomas and Co., makers of the Coventry Excelsior, and is shown fitted to one of their 2½ h.p. two-stroke machines recently delivered to a local client.

A metal case for the accumulator is carried under the tank and behind the engine, being attached to the tube below the tank by two metal straps and steadied by a flat bar carried down to a joint of the gear box bracket. The case is enamelled and lined to match the tank in the usual Excelsior colours. A pair of four volt twenty ampère hour accumulators are carried side by side, one in use and one in reserve. Simple wiring is connected to the lamp.

The H.H. head light is provided with a very efficient reflector and metal filament lamp giving low consumption,

and a neat switch is provided at the back of the lamp, which can be reached from the saddle.

The rear light is fitted on the carrier, and is controlled by a separate switch. Hunt lamps, with all black finish, are used.

Recharging of the accumulators is the only expense entailed, and as each cell is said to give fifteen hours continuous light the necessity to recharge will not occur often. The whole set complete with carrying case, one accumulator, lamps, and wiring sells at £3 10s. net, a spare lamp bulb in a safe carrying case being included.

The machine to which this lighting set is fitted has a particularly smart appearance, and a short trial run served to show that it has a considerable reserve of power. Speeds up to 30 m.p.h. were easily obtained on about half throttle; no doubt it would exceed 40 m.p.h. if necessary, and should do most of its climbing on top gear. It is chain-driven throughout, yet it was difficult to notice any difference from belt drive. A two-speed gear with substantial control levers, together with a handle-bar operated clutch, make it extremely easy to handle.

### THE LIMIT IN LIGHTWEIGHTS.

**T**HE photographs on this page of a novel lightweight motor bicycle have been forwarded to us by M. H. Duvauchelle, an enthusiastic French reader of *The Motor Cycle*. He is a clever amateur mechanic and a pilot working on the Seine Estuary, and up that river as far as Rouen. The machine has been made specially light so that it can be easily taken ashore from his steam tug. The weight is 50 lb., 20in. wheels are employed, and a 1 h.p. four-stroke 50 mm. x 55 mm. engine, which develops its power at 2,450 r.p.m., is fitted. The engine has an outside flywheel. The machine's maximum speed is 19 m.p.h., and last month, we are told, it travelled 500 miles. The transmission is by chain, and spring forks are used.

#### A LIGHTWEIGHT INDEED!

A Frenchman's 1 h.p. two-wheeled runabout, which weighs only 50 lb.

"GASOLINE CAVALRY," or, in plain English, United States infantry on Harley-Davidson sidecars used for the protection of Mexican border towns against raids

## A New Lightweight Grandex.

2½ h.p. Two-stroke Engine, 55 mm. × 70 mm. = 232 c.c.; Two-speed Countershaft Gear.

WE recently had an opportunity of examining the new 2½ h.p. two-stroke Grandex. As will be seen from the illustration, this is a most attractive looking little machine. The frame is symmetrical in design, having a sloping top tube and a tapered tank holding just over a gallon of petrol. The forward portion is devoted to lubricating oil, which is fed through a Best and Lloyd semi-automatic drip feed lubricator to the induction port. The engine is the well-known 2½ h.p. Precision two-stroke, and it is interesting to note that the 2½ h.p. four-stroke J.A.P. engine can be fitted into the existing frame without alteration. Great care has been exercised in rendering this engine oil-tight, the bearings being most efficiently packed with this end in view. Care has also been taken to render the machine adequately silent, the silencer being of ample dimensions and of great thickness so as to deaden all noise. The exhaust from the relief valve does not pass into the open air, but through a special pipe is transferred into the exhaust outlet.

### A Three-sprocket Chain Drive.

A noteworthy feature is the three-point drive, by means of which the magneto is driven by the same chain, which also conveys the power from the engine to the countershaft, and this

Grandex power unit from the transmission side, showing unusual arrangement of single chain drive for magneto and transmission.

chain, it will be noticed, is adequately protected. The gear box is a two-speed Albion. A feature of the frame construction is that the chain stays form a single piece with the bottom frame member, which greatly adds to the strength. All parts, such as mudguards, luggage carrier, and stand, are most sub-

stantial, and, though the machine is a lightweight, strength has not in any single case been sacrificed to lightness. It will be noticed that comfortable foot-boards are provided. Points of convenience have been carefully studied, and a drain tap is fitted to the rear of the tank, so that petrol can always be obtained for cleaning purposes if desired. A very excellent foot brake is fitted, which acts on the inside of the belt rim. The brake shoe is of V section and is lined with Ferodo.

### TAN-SAD PILLION SEAT.

WHATEVER may be said against the practice of pillion riding, it will always be indulged in by many persons. No doubt some accidents occur through the passenger being jolted from the rough and ready seat usually mounted on an unsprung carrier. This danger is entirely obviated by a new form of pillion

The Tan-Sad pillion seat.

seat known as the Tan-Sad. It consists of a strong metal frame provided with a set of clamps for attachment to the ordinary carrier. This is done by turning the two bars between the clamps with a small punch or rod and drawing in the clamps till they grip the carrier tightly. Pivoted at the front end of this frame is another frame carrying an upholstered leather seat; the back connection is made with four coil springs, thus providing a well sprung seat which effectively absorbs road shocks. Additional springs may be added if necessary. It can be obtained from the Tan-Sad Works, 5a, Parker Street, Edgbaston, Birmingham.

The new 2½ h.p. two-stroke Grandex. A sloping tank and Albion two-speed countershaft gear are features.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Latest Recruits in the M.M.G S. This Week's Vacancies.

**F**URTHER instructions for recruits for the Motor Machine Gun Service have been received from the commanding officer of this section, Lt.-Col. R. J. Colson, and applications from experienced motor cyclists and car drivers are invited on the same terms as previously. Inspections have been arranged as follows:

LONDON.—Saturday, July 15th, at *The Motor Cycle* Offices, 20, Tudor Street, London, E.C., from 2 to 4 p.m.

COVENTRY.—Tuesday, July 18th, Recruiting Office, Little Park Street, from 12 to 4.30 p.m.

Readers conforming to the conditions of enlistment who may be ready for immediate service may attend at Coventry without previous notification. It would, however, be wise for all applicants to be examined before the Medical Board at the headquarters of their respective places of attestation previously.

The conditions of enlistment in the Motor Machine Gun Service are repeated below:

AGE.—19 to 40.

ENLISTMENT.—For duration of the war.

MEDICALLY FIT.—For general service abroad or for garrison duty abroad.

PAY.—1s. 2½d. per day, all found; the usual separation or dependant's allowance.

Last week inspections of recruits were held in Coventry (on Tuesday) and Not-

## Central Office for Motor Machine Gun Service:

tingham (on Wednesday), when the following candidates were accepted:

Addy, J. F., Boston, Lincs.  
Allott, R. A., Netherfield.  
Baker, C. J., Heckington.  
Boydall, L. A., Nottingham.  
Core, F., Coventry.  
Dakin, E., Clay Cross.  
Donaldson, L., Mansfield-Woodhouse.  
Dunston, G., Wells, Som.  
Fielder, A., Freshwater, I.O.W.  
Flower, J., Derby.  
Forman, T. R., Newcastle-on-Tyne.  
Horner, A., Beeston, Leeds.  
Jones, J. O., Wellingborough.  
King, G. H., Eggleston.  
Lambert, C. E. B., Witham, Bath.  
Mann, G. B., Mirfield.  
Manning, A., South Molton.  
Melhuish, F., Harborne, Birmingham.  
Moore, J., Birmingham.  
Myers, S., Calverley.  
Nash, O., Coventry.  
Ogden, F., Little Aston, Staffs.  
Petts, J. W., Clay Cross.  
Pogmore, W. T., Mansfield-Woodhouse.  
Preston, J., Nelson.  
Raymond, A., Coventry.  
Robinson, J. W., Darlington.  
Stretton, F., Much Wenlock.  
Thompson, J. T., Coventry.  
Turner, D., Coventry.  
Wagstaff, E. H., Leicester.  
Watson, A., Burnley.  
Wilkins, W., Wells, Som.  
Wood, S., Luddley, Huddersfield.

We frequently receive applications from men of eighteen years of age who desire to enlist in the Motor Machine Gun

Service. For future guidance, it should be noted that the present minimum age is 18½.

## New Age Limits for Despatch Riders.

It should be noted by prospective despatch riders in the Royal Engineers' Signal Section that a new rule fixes the age limits between eighteen years and nine months and thirty-five.

## R.E. Inland Water Transport Section.

Recruits are required for the above Section for service abroad, steam tugs, steam barges, and canal barges. A certain number of men with a complete knowledge of internal combustion engines are wanted. Age limits, nineteen to forty.

## Royal Flying Corps.

From July 17th to 22nd a trade testing party will be in attendance at the Recruiting Office, High Street, Stockton-on-Tees, in order to test men of the different R.F.C. trades.

## A Keen Youngster.

An enthusiastic youth of eighteen, having failed to secure local enlistment in the Royal Flying Corps, communicated with the headquarters at Farnborough, Mr. Pemberton Billing, and finally His Majesty the King, but all with no success. He enquires if we can assist him!

(Left) Tech. Sgt.-Maj. F. Farrer, R.F.C., makes good use of his two-stroke Velocette in visiting the various parts of the aerodrome.

(Right) Sgt.-Maj. Fields, Durham Light Infantry, finds his Douglas very helpful in enabling him to visit the various training grounds.

(Below) Petty-officer Godfrey W. Turner, Admiralty Recruiter, covers 200 miles per week on his O.K. in the course of his duties.

## MILITARY AND NAVAL NOTES.

## EXCITING TIMES WITH AN A.S.C. DESPATCH RIDER.

NEWS of the experiences of motor cyclists attached to the A.S.C. is not so common as that of the R.E. despatch riders; hence the following extracts from a letter from a man in the former will be welcome. The writer is J. Scott Anderson, an old member of the Glasgow M.C.C., who has been in France for twelve months. He is an A.S.C.

motor cyclist with a siege battery, R.G.A., and from the following it will be gathered that, though on the whole the risks run by military motor cyclists are not great, there are occasions when England would be considered distinctly safer!

"The other day I had to take one of our officers up to an 'O. Pip' (observation post), and during the time I was waiting for him a bullet whizzed through the front of the sidecar.

"Last week after returning with an officer from the O.P. with our sidecar the chain broke. The officer naturally left me, and walked to the nearest battery

to obtain a motor bicycle to take him home. At the same time he 'phoned to H.Q. for one of my chums to come and assist me. All I had to do the job with was a small 'King Dick' and a screwdriver (tool-kits are very difficult to get nowadays), so his assistance was very useful. We were only about 700 yards from the Bosche, and before we had been at it very long over came their shrapnel, whizzbangs, and all manner of things; it was a matter of jumping in and out of the ditch until they quietened down.

"This is only one of the many experiences I have had of this kind, and although we are in the A.S.C. we have to be prepared to take on dangerous jobs quite as often as any R.E. rider. The latter's work consists chiefly of carrying despatches (mostly secret) from and to their brigades H.Q., which are usually three or four miles behind the lines. Our work consists of carrying despatches from the Group Headquarters to the various batteries, the latter being sometimes quite close to the trenches. Riding down a road which is being shelled is quite an ordinary occurrence.

## IN INDIA WITH THE M.M.G.S.

THERE are now batteries of the Motor Machine Gun Section in various parts of the world, though we hear more of the doings of those in France than elsewhere. For this reason a letter

from a man with a battery in India is all the more welcome. It is from Sgt. A. Fielder, and it gives a good impression of the life men of this particular battery are leading out there. The following are extracts from Fielder's letter:

"We are very comfortable here, and, although rather hot, are getting used to it. We have just returned from a thousand mile patrol duty, and a brief description might interest you. We started from Pindi on April 5th for Nowshera, a distance of eighty miles, passing Fort Attock, near Hindus, and Kabul on the way, and had a decent journey, except for the dust, which was awful. We stopped at Nowshera on the 6th. On the 7th we left for Chakdara Fort, up on the frontier, passing Mardan Malakan Forts, etc.; distance sixty miles. As this is up on the Himalaya Mountains, it was a fairly stiff climb. On the 8th we went field firing. The object of this was to put the fear of God into the native chief and tribesmen, which we fairly succeeded in doing, returning afterwards to Mardan; distance fifty miles. In the evening we went to see an Indian war dance, which is a very impressive sort of affair.

## Through Heavy Rain.

"The 9th, being Sunday, we spent tuning up our cycles. On the 10th we left for Peshawar in the pouring rain, and arrived covered with mud, etc.; distance forty-five miles. On the 11th we went to Landikotal Fort, through the Khyber Pass, returning to Peshawar the same day; distance seventy-five miles. The road was very dangerous, being twisty and right at the edge of the cliffs. On the 12th we were inspected by the Chief Commissioner, who was very satisfied with our work. On the 13th we went to Chubbudda for field firing (this was where a big 'scrap' took place last August), returning afterwards to Peshawar; distance fifty miles. The 14th (day of rest) was spent overhauling the machines. On the 15th we were inspected

by the General in Command before leaving for Kohat; distance forty miles. On the 17th we left Kohat for Thall, a nice journey; distance sixty-one miles. On the 18th we left for Parachina, right up on the hills, where it was very cold at night, snow being on the hills just above; distance fifty-nine miles. On the 19th we went field firing on the Afghan frontier, afterwards returning to Thall; distance eighty miles. Here the natives held sports in our honour, and some of the performances were very good, especially their horsemanship.

## An Inspection.

"On the 20th we left for Kohat, where we were inspected by the General in Command, afterwards going field firing; distance seventy miles. On the 22nd we left for Bannu, a good journey, crossing several fords two feet deep; distance seventy-nine miles. On the 24th we left for Mirenshaw, over most awful roads; distance forty miles. One of the biggest frontier 'scraps' have occurred here. Quite a pleasant place to spend Bank Holiday in. On the 25th we left for Bannu, a distance of forty miles, tuned up machines, etc. On the 26th we went field firing, and afterwards had a lecture by General Fane. On the 27th we returned to Kohat, a good journey; distance seventy-nine miles. On the 29th we returned to Peshawar, the hardest climb in the whole journey. On May 1st we left Peshawar for Pindi, a distance of 117 miles, in the pouring rain, and so ended a month's hard travelling. "Being the sergeant-mechanic in charge, I had a fairly busy time of it."

We are told that some sixty members of the Cape Peninsula M.C.C. are now on active service.

Capt. Stenson Cooke, in civilian life secretary of the A.A. and M.U., has been promoted to major on the Headquarters Staff at the War Office.

SERGEANTS OF A M.M.G.S. BATTERY NOW IN INDIA. The names are, from left to right—Kellett, Fielder, Ward, Whitfield, and Barton. All are on Triumphs, which, Sgt. Fielder informs us, are giving every satisfaction.

### Ten Thousand Recruits.

The ten thousand mark was passed last week in our official work of recruiting for the M.M.C.S., Heavy Section, M.G.C., and R.E. Signal Service.

### Trading with Enemy Firms.

We congratulate the Daimler Co. on its ultimate victory in its recent case against the Continental Tyre Co. (a German concern). At last law and justice are in agreement.

### Small Demands Satisfied.

A discharged Army man, who last week returned from a motor cycle tour extending from the East Coast to Wales and then to London, reports that he had no difficulty in purchasing petrol at one and all his replenishing stations. Perhaps it was because a motor cycle requires but a gallon or so to "fill up."

### Petrol Imports.

No less than 19,820,337 gallons of motor spirit were imported during the last month and 69,478,569 gallons during the half-year. Duty was paid on upwards of nine millions and fifty-five millions respectively. Upwards of seven million gallons more petrol were imported during the past month than in June, 1915.

### Sidecar Runs for Wounded Soldiers.

A motor cyclist, Cpl. E. J. Langley, who is now convalescent at the Military Hospital, Lewisham, would be grateful to any sidecar driver who would take him for an occasional run. On Thursday, Friday, and Saturday he is free from 1 to 6.30 p.m. Langley has served at the Dardanelles, and was invalided home in the spring.

### Light Cars and Wounded Soldiers.

The many parts played by light cars in restoring to health wounded soldiers are brought out in a striking manner in the issue of *The Light Car*, published yesterday (Wednesday). It is a special Red Cross number, and there are many articles dealing with this subject, set forth in the attractive manner that has become such an appreciated feature of our contemporary. An article by B. Alan Hill, a well-known motor cyclist and light car owner, entitled "A Day in the Life of an Ambulance Driver," is sure to interest readers. Some months ago Mr. Hill was invalided out of the Red Cross service.

## SPECIAL FEATURES

SIDECAR BODY DESIGN.

THE SAILORS' SIDECAR OUTING.

ELECTRIC LIGHTING FOR LIGHTWEIGHTS.

### A Warning.

Motor cyclists are advised to exercise special caution in the neighbourhood of Magul (on the road from Liverpool to Southport), and to see that their brakes and lamps conform to the law.

### No Decline in Prices.

Second-hand machines still maintain their high values. Many a motor cyclist who bought a motor cycle, new or second-hand, during the "doubtful" autumn and winter seasons of 1914-15, can still get at least as much as he paid. And there is no sign of a decline yet.

### The Motor Cycle to the Rescue.

An exciting story was told at the Kingston Court last week, when a woman was charged with stealing clothing. The girl shop assistant, who took the goods on approval, started to chase the woman on foot, and finally enlisted the services of a motor cyclist, who took her on the carrier of his machine and then fetched a policeman.

### Petrol Estimates.

Estimates of petrol requirements having been on the high side, practically everybody, including business houses, so it is said, will have to be satisfied with a reduced allotment.

The R.A.C., a day or so before the cards were officially due, warned motorists against overstatements of their requirements.

### Boosting Sidecarriers.

We wish gratefully to acknowledge many letters of appreciation we have received as a result of our special Economy and Utility Number of *The Motor Cycle*, and at the same time to thank those readers who handed over their copies of the paper to tradesmen.

### Oldham Motor Club's Wounded Soldiers' Outing.

The third motor outing for wounded soldiers organised by the Oldham and District Motor Club was held on Sunday, the 2nd inst. Of the ninety motor vehicles used sixty were motor cycles and sidecars. After collecting the men they proceeded to Scammonden, where tea was taken, after which a concert was given. The return journey was commenced at about 7 p.m., and all voted the outing a great success.

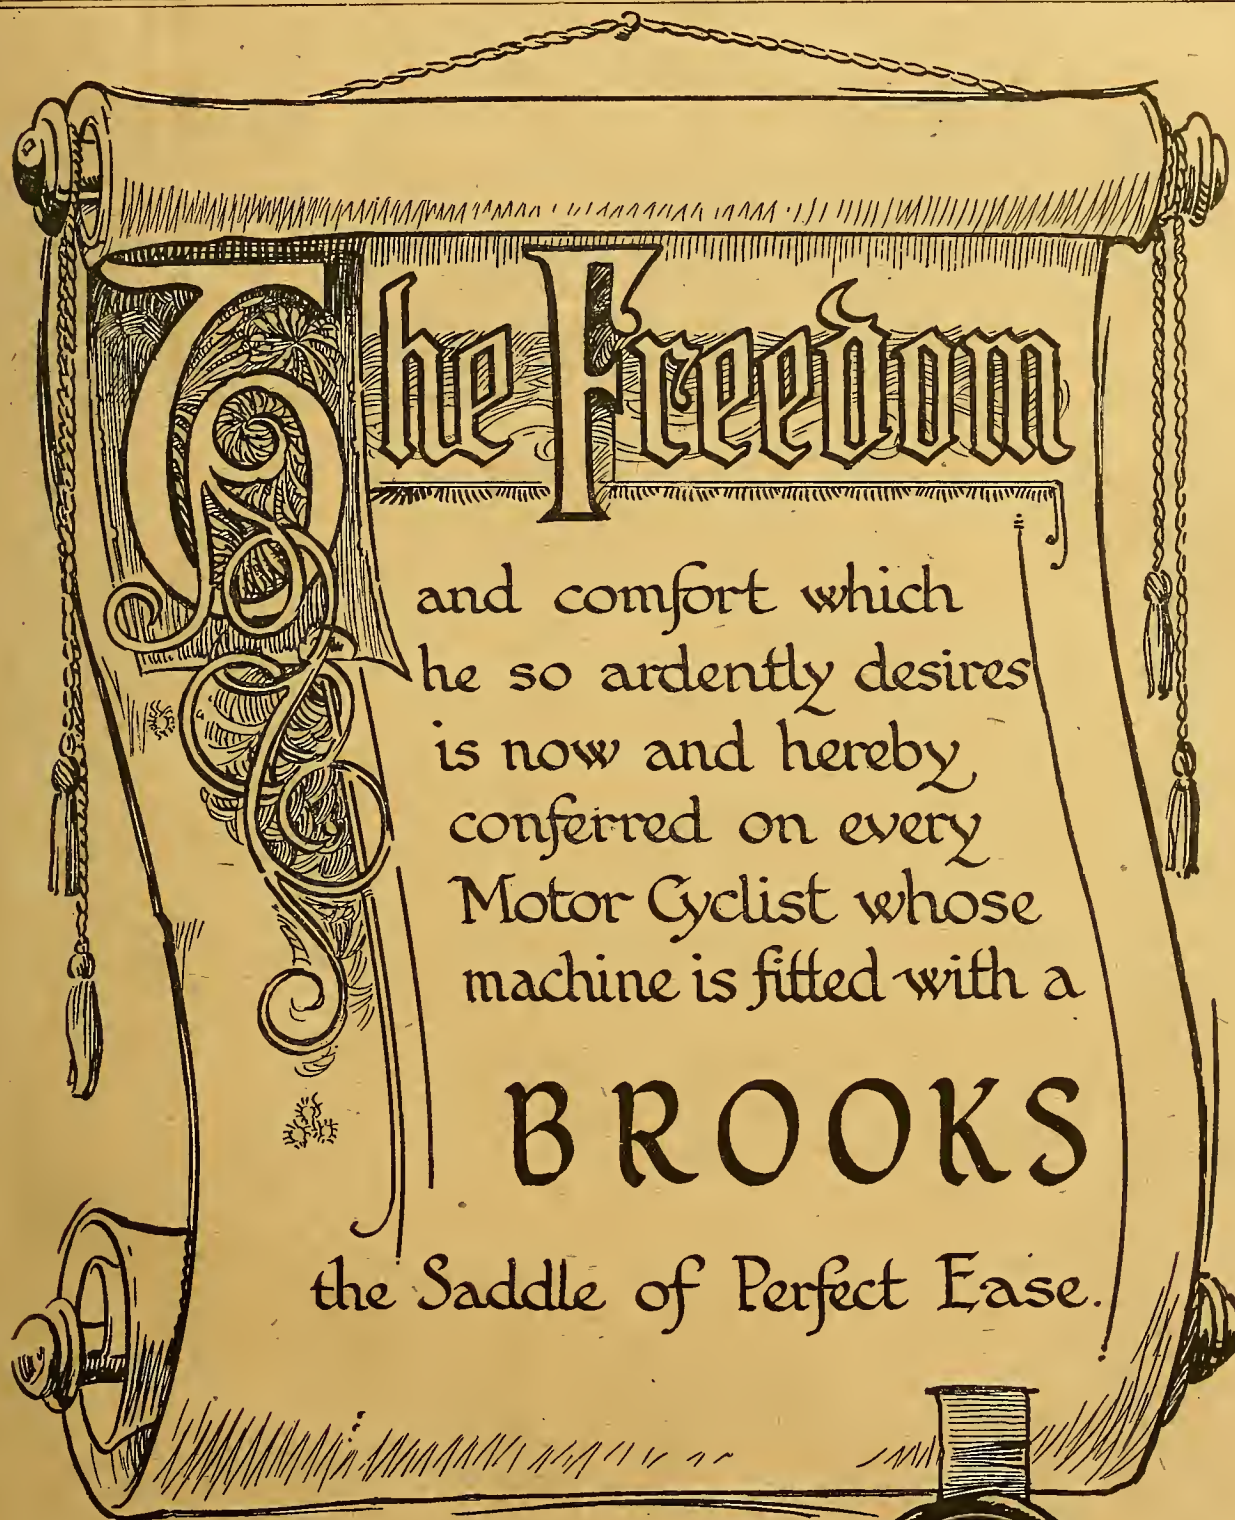

### The Petrol Census.

Up to the present particulars relating to at least 300,000 motor vehicles have been received by the Petrol Control Committee, and in a few days this body will be in possession of the complete statistics of the recent petrol census. There is little doubt but that considerable restrictions in the consumption of spirit will have to be enforced in the near future, as it is stated that the estimated scarcity is serious. No action is to take place till after the Finance Bill has passed through Parliament.

The start of the sailors' sidecar outing from the Palace Yard, Westminster Abbey, to which point the Jutland Battle heroes had been brought from Greenwich Hospital on motor 'buses.

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

"The Choice of  
those who want The Best."

# NEW HUDSON

UTILITY — DEPENDABILITY — ECONOMY  
were never so perfectly welded as in the  
**BIG SIX COMBINATION.**

The luxury of a car with the economy of a Motor Cycle, affording the cheapest form of motoring.

The Big Six Motor gives a steady flow of power and speed, only limited by your desire; its flexibility is such that it is easily restrained to a walking pace, even on the top gear, picking up instantly.

Those who had the good fortune to secure a 1916 model, the delivery of which has been restricted by Government's requirements, are loud in praise of its impressive appearance, advanced design, workmanlike construction; its vigorous yet silky running, together with the serviceability of its fitments for all weathers.

All these desirable features, however, are eclipsed in value by its dependable service and inbuilt endurance qualities; combined they have earned for this model the title of

*The Incomparable Twin.*

THE NEW HUDSON CYCLE Co., LIMITED,  
PARADE MILLS, BIRMINGHAM.

LONDON: 44-45, Gray's Inn Road.

WRITE  
FOR  
CATALOGUE.

### THE NEW PETROL DUTY.

We understand that the motor spirit licence duty will come into operation on August 1st.

### The National War Funds.

At the week-end the principal relief funds stood as follow:

The Prince of Wales's Fund ..	£5,918,210	0	0
Fund for the Sick and Wounded ..	4,044,450	0	0
Tobacco Fund ..	109,952	15	0
The Queen's Work for Women Fund ..	170,001	0	0

### Week-end Doings in "The Motor Cycle."

The wounded sailors' sidecar outing to Lord Northcliffe's estate, held on Saturday last, the 8th inst., is described in this issue. *The Motor Cycle* regularly includes all the week-end news in the succeeding issue.

### Estimated Petrol Requirements.

It would be interesting to know, now that the Petrol Committee of the Board of Trade have had an opportunity of investigating the demands as shown by the petrol forms supplied by motorists, whether they tally in any manner with the estimate of requirements announced in the House a fortnight ago. One wonders why the returns were not examined first, and the figures afterwards issued from concrete evidence.

### New Owners and Petrol.

Judging by letters received, an official pronouncement by the Petrol Committee would be welcomed on the position of purchasers of motor vehicles since the taking of the petrol census. Some readers who have acquired motor cycles during the past fortnight are anxious about obtaining petrol if and when any restrictions are in force. The only thing to do is to fill in a petrol census card without delay, and state clearly the reason for not having sent it in to the Control Committee by the date of the census.

### The Imports and Exports of Motor Cycles.

In view of the prohibition of imports, it is not surprising that the number of motor cycles which entered this country is far less for the past month than in June, 1915, the numbers being as follow:

1914. ...	1915. ...	1916.
400 ...	822 ...	57

and the value with parts—

1914. ...	1915. ...	1916.
£23,409 ...	£65,671 ...	£15,192

The exports may be considered very satisfactory, the number of motor cycles exported in June being practically the same as last year, and the total for the half-year considerably larger.

Number of motor cycles exported in June:

1914. ...	1915. ...	1916.
1,958 ...	1,020 ...	1,016

Number exported in the half-year:

1914. ...	1915. ...	1916.
10,818 ...	4,734 ...	5,599

The value of the exported motor cycles and parts is as follows:

June—1914. ...	1915. ...	1916.
£119,934 ...	£68,162 ...	£71,187

Half-year—

1914. ...	1915. ...	1916.
£648,206 ...	£343,649 ...	£435,611

### Reception to American Trade Visitors.

Yesterday (Wednesday) evening the London board of directors of the Harley-Davidson Motor Co., Ltd., gave a reception and dinner to the Milwaukee directors, Mr. Walter Davidson (president of the company) and his colleague, Mr. J. A. Stone, who are on a visit to this country. They attended the sailors' sidecar outing last Saturday.

### Goods of Enemy Origin.

The Management Committee of the A.C.U. considers that the Union should put on record its opinion that no motor cycle sold as of British manufacture should contain any part of enemy origin, and it invites the co-operation of the C. and M.C.M. and T.U. in achieving this result.

### Climbing Applecross on a Lightweight.

A Ross-shire doctor writes to the effect that he has climbed Applecross, from both sides, on the same afternoon, his machine being a 1915 model 2½ h.p. O.K. Junior. It is a standard machine, we are told, with standard gears, and no special tuning was made, the climbs being done during the course of professional visits in the district. The rider stopped once on each side to let his engine cool, and then climbed the remainder without trouble. It was a warm day, but, nevertheless, there was snow on the summit, which is 2,054ft above sea level.

### The R.F.C. Motor Cycle.

As is fairly generally known, the P. and M. is the standard motor cycle adopted by the R.F.C., but owing to the enormous and rapid growth of this corps colossal demands were made upon the P. and M. Co. some weeks ago for the supply of motor cycles and spare parts for the different depots. Temporarily, the company were unable fully to meet these demands, and consequently a small number of machines of other makes were borrowed from the C.I.M.T. for the use of squadrons in training in England. Latterly, however, Messrs. Phelon and Moore, Ltd., have been able to effect a greatly increased output, which will enable them to meet all demands of the R.F.C., so that very shortly the P. and M. will once more reign supreme, and gradually machines of other makes will be withdrawn.

### S.O.S.

Extract from a letter from a reader seeking advice on the running of his machine: "Should I ... fit a longer wire from the magneto to the plugs, so that the spark will occur later?"

### Unusual Speed Limit Orders

The Automobile Association has been unformed of Orders just issued by the Local Government Board, which should be carefully noted by motorists. From half an hour after sunset until half an hour before sunrise motor cars and motor cycles in the borough of Portsmouth must observe a speed limit of ten miles per hour. This Order will be operative for twelve months.

A ten-mile speed limit has also been imposed for a period of twelve months in respect of a portion of the Upper Shoreham Road (from Mill Lane to the Shoreham Golf Club House), which passes through the military camp.

## Average Prices or Second-hand Machines.

WE give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average that appeared is given, if within four weeks.

THE WOUNDED SAILORS' SIDECAR OUTING. A halt near Guildford.

## THE ARBUTHNOT TROPHY.

### A.C.U. ADOPT "THE MOTOR CYCLE" SUGGESTION.

**A**T a meeting of the General Committee of the Auto Cycle Union, held on the 6th inst., the following resolutions were passed unanimously:

1. That in order to perpetuate the memory of the late Rear-Admiral Sir R. K. Arbuthnot, Bart., C.B., M.V.O., and his association with the motor cycle movement, a challenge trophy, to be known as "The Admiral Arbuthnot Trophy," shall be put up, to be run off annually under the competition rules of the Auto Cycle Union, and to be competed for by any gentleman holding a commission in H.M. Naval Forces.

2. That the first competition shall be organised as soon after the cessation of hostilities as possible, and that the Competitions Committee of the A.C.U. should be instructed to draw up the regulations.

3. That a fund be created for the purchase of a suitable trophy.

It was agreed that the trophy should take the form of a statuette of the late Admiral, and that the regulations should be drawn up as soon as possible, so that

no unnecessary time should be lost between the cessation of hostilities and the holding of the first competition. In the meantime, Mr. T. W. Loughborough, the A.C.U. secretary, will be very glad to receive donations to the fund for the purchase of the trophy, and begs to announce that the following donations have already been promised:

Royal Automobile Club	...	...	£5	5	0
Auto Cycle Union	...	...	5	5	0
Hendee Manufacturing Co.	...	...	5	5	0
Messrs. Iliffe and Sons Ltd. (proprietors of <i>The Motor Cycle</i> )	...	...	5	5	0

W. H. Wells, Esq.	...	...	1	1	0
Julian W. Orde, Esq.	...	...	1	1	0

### R.E. DESPATCH RIDERS STATIONED NEAR THE SUEZ CANAL.

All the men shown saw service in Gallipoli. There are five Triumphs and one Colonial Douglas. Names from left to right: Cpls. Middleton (standing), Talbot, Rounds, Gibson, Wrightson (standing), 2nd Lt. W. Murdoch, Cpls. Riley (standing), Jarvie, Taylor, and Webster (standing). We have to thank Lt. Murdoch for the photograph, who, though in the picture, does not belong to the D.R.'s.

## THE SAILORS' SIDECAR OUTING.

Wounded Heroes of the Jutland Battle enjoy a Trip into Surrey.

Crossing Putney Heath.

**A** SULLEN sea and lowering sky. Far out on the horizon the smudges of smoke that betray the presence of the grey sentinels that guard these shores.

Aboard them there is a mighty silence broken only by the sharp ringing of the telephonic controls. The Fleet is going into action. Boom! boom!—long-drawn-out muttering of heavy guns. The enemy has opened the ball. It is at last *Der Tag*.

Around the Fleet fountains of foam spring up as if from a hundred whales that have suddenly spouted.

Men stripped to the waist, bootless, with their wide trousers rolled well up to their knees, handle their mighty weapons. Enclosed in their steel turrets they sail into the fight. Crash goes a 15in. Crash! crash! crash! follow its sisters. Crash, and yet again and again crash and bellow and crash—crescendoes of mighty sound, deafening, terrifying, stupendous spasms of noise, leaping up and up the scale of frightful discord, never-ending hideousness that swells and swells into one great devastating roar.

An appalling crash that leaps into the smoke and stuns even the smashing sound of our own great guns. A shell has burst in the aft barquette. There, there is death, death and hideous appalling wounds, a welter of blood and agony, of wire, steel and twisted framework.

That is one aspect. Now look on this. A quiet and gracious place it is, and lies in the pleasant pastures of wooded Surrey. An old, old place. A building of bygone days set upon fair lawns and

surrounded by stately trees. The voices of fair women and the laughter of little children, intermingled with the deep tones of those brave fellows who took part in the scene first described.

The first scene was in the battle off Jutland, the second in the outing given by the Harley-Davidson Motor Co. to wounded sailors. And now as to the outing itself.

### A Prompt Start.

Starting promptly from the Old Palace Yard at Westminster Abbey, a fleet of fifty Harley-Davidson sidecar combinations weigh anchor at 12.15 p.m. with its sailor passengers for Sutton Place, the residence of Lord Northcliffe, who kindly placed his grounds at the disposal of Messrs. Harley-Davidson for the *fête*.

A delightful run was anticipated, and those anticipations were fulfilled. Nothing could have been more delightful, and the weather was perfect. All too soon the long line of sidecars and their attendant cars passed through the pleasant villages of Esher, Cobham, and Ripley, the sailors receiving many a salute and heartening cheer from the passers-by and inhabitants.

The first stop was made just outside the entrance to Sutton Place, and here the whole *cortège* halted, and was photographed, to the huge delight of the sailor passengers.

Mr. Walter Davidson, one of the American directors of the Harley-Davidson Co. Mr. Davidson and his colleague, Mr. J. A. Stone, are on a special visit to this country.

### The Sailors' Sidecar Outing.—

An amusing incident occurred as the sidecars turned in at the park entrance. A large carthorse, evidently taking it into his head to join in the fun, accelerated down the drive on top speed. "Throw a hawser to him, Bill," shouted one of the sailors.

After lining up, both passengers and drivers adjourned to get rid of "the dust of battle," as one jolly Tar put it, and so on into lunch, which was served in a large marquee. One hundred and twelve people sat down to this, and an excellent lunch it was, and enjoyed to the full by the guests. Gusts of laughter, the popping of corks, and the clatter of knives showed what a trencherman Jack is.

Arbuthnot, who went down with his ship, the *Defence*, in particular. There was to be an Arbuthnot Trophy Cup, which was only to be competed for among the members of His Majesty's Senior Service—the Royal Navy.

He told an amusing incident he had heard coming down. The little son of Fleet-Surgeon Stewart, who was in one of the cars following the sidecars, pointed out to him the stream of sidecars, and said; "It must be very nice to be in one of those little boats, but I should much rather be in this big cruiser."

Sgt. Smethurst, of the Marines, in returning thanks, informed the company in general that the best way, to his thinking, was to give three cheers. When

we had taken our hands from our ears, Sgt. Smethurst had gracefully sat down—all good luck to him.

Fleet-Surgeon Stewart then spoke, and proposed the toast of "The H.D. Co.," who, he said, had spared no trouble in making that a memorable day for the sailors.

### A Medical Opinion.

He stated, with medical authority, that motor runs accelerated the convalescence of the wounded by 25%, and that when the men got back they ought to be ready to be discharged.

Mr. Walter Davidson said that he felt rather chary of taking a sidecar combination down, as the rules of the road were so different in America, but (said he) he had risked it, and had arrived safely and had not caused more wounds.

After lunch a musical entertainment was provided, to the great and unrestrained delight of the guests. This was over all too soon, as Mr. Masters, the organising secretary, informed us that the hospital authorities insisted upon the return of the sailors by 6.15. At 4.15 the order was passed round, "All aboard." "Where's my chauffeur?" was the call, and so, to the music of many bubbling exhausts, the fleet got under way again for home, which was reached safely at 5.30, both sailors and guests cheering to the echo. The last call from those brave boys as they disappeared from our view was, "Are we downhearted?" and our answer was "No!" Well, are we?

Wounded heroes of the Jutland naval battle were entertained on Saturday last to a sidecar outing to Lord Northcliffe's estate. The top view shows the procession passing the Hut Hotel at Wisley.

Centre:  
The cross roads at  
Thames Ditton

- Bottom:  
Passing through  
Esher.

At the lunch were present Mr. Walter Davidson, president of the Harley-Davidson Co., and his colleague, Mr. J. A. Stone; Mr. Duncan Watson, director of the London Board of the Harley-Davidson Co.; Fleet-Surgeon Stewart, R.N., the Admiralty representative; and Mr. Otto Thomas (*The Motor Cycle*), chairman of the A.C.U.

### The Toasts.

The first toast, that of "The King," was proposed by Mr. Duncan Watson, and was drunk after the whole of the guests had sung the National Anthem. Mr. Duncan Watson, in his speech that followed, pointed out that motor cycling had always been associated with the Navy, and with Rear Admiral Sir Robert

## PETROL ECONOMY.

## RUNNING MOTOR CYCLE ENGINES ON GAS FROM THE TOWN SUPPLY.

This method has been adopted in the test shop of Messrs. A. J. Stevens and Co., Ltd., makers of the A.J.S. In view of the prohibitive cost and scarcity of petrol, this system may appeal to other makers.

**N**OW that the price of petrol is so high, we were naturally very interested to hear, when recently at the A.J.S. works at Wolverhampton, that the makers were utilising coal gas as a fuel for running engines when being tested on the bench. We were told that the power and speed were not quite so good as when petrol was used, but the results obtained were quite satisfactory, as the comparative results were much the same, while the saving of trouble and mess was quite considerable.

The method of supplying the gas is simple in the extreme. A large main gas supply pipe runs along the back of the test bench, and small branch pipes are taken off and lead direct to the engines. At the induction pipe entrance a bunsen burner attachment is fitted up, so that the quality of the mixture can be

adjusted when necessary, while the speed may be varied by turning on or off the gas supply.

At first the gas was introduced directly into the ordinary carburetter. This worked quite satisfactorily but was not quite so convenient as the present arrangement. The engines show no signs of overheating, and start quite satisfactorily on the gas. We saw two engines running in this manner, one a  $2\frac{3}{4}$  h.p. single, the other a 4 h.p. twin, and both appeared to run with perfect regularity.

## AN A.B.C. IMPROVEMENT.

**F**EW firms are more up-to-date or progressive than A.B.C. Motors, Ltd. They have succeeded in producing one of the most ingenious and original, and at the same time practical, machines at present on the market, and only an excess of Government work prevents their supplying these to the public.

The latest development is the introduction of a new type of hub which contains two internal expanding brakes working independently, one of which is actuated from the handle-bar and the other by the pedal. The brake drum forms part of the hub, and thus the tendency to unscrew that arises with screwed-in brake drums is avoided. The brakes are made of a cast aluminium alloy, lined with Raybestos and provided with hardened steel plates where the cams make contact. It will be noticed that the brake drum is ribbed so as to assist cooling. Another point of interest in connection with this hub is that two separate and distinct transmission shock absorbers are fitted.

A.B.C. brake drum. The left view shows drum and sprocket in position, while that on the right shows the drums detached and the manner of their working side by side.

# THE AUTO CYCLE UNION REPORT.

Useful Work in Connection with Recruiting and Taxes.

**B**ELOW we give extracts from the report of the Management Committee of the Auto Cycle Union, dealing with the work accomplished during the first half of 1916.

## Membership.

Having regard to the unprecedented conditions, the membership, with the exception of that of the Affiliated Clubs, may be considered satisfactory.

## Finance.

As will be gathered from the report on membership the receipts from subscriptions are satisfactory, amounting to over 75% of the estimated income from this source for the year. Receipts from other sources are also up to expectations. On the expenditure side further reductions under every heading, as compared with last year, were made when preparing the 1916 Budget, and it has been found possible to work to these figures. The Insurance Department has also succeeded in paying its way.

## Recruiting.

Up to within the last few weeks the staff has been busily engaged in recruiting for the Motor Cyclist Section, R.E. Mr. Loughborough's scheme of a Central Office to co-ordinate the work of the various local "Reserve Committees" proved invaluable, and gradually became so automatic in working that it was taken over by the military authorities, whilst at the same time the introduction of universal military service eliminated the majority of the difficulties that had faced those who have endeavoured so successfully to find the right men for this special branch of the Army. Since the Central Office was established in January 804 recruits were "finally approved," whilst during this period 1,779 applicants were interviewed, and some 3,400 applications by letter were dealt with. In connection with this matter letters of appreciation and thanks were received from the War Office, and from the Signal Service, R.E.

## Legislation.

The recent proposals, now happily withdrawn, for increased taxation of motor cycles called for energetic action on the part of the Union. Within a few hours of the Chancellor's announcement on April 4th, the Secretary was in consultation with Treasury officials, and for some considerable time thereafter, both independently and in collaboration with the Royal Automobile Club, every effort was made to convince the Government that, particularly as regards motor cycles, the proposed taxes were most unfair. A complete statement of the arguments for and against taxation was submitted to the Government before the end of April, from which the following paragraph is extracted: "The above two methods of gradation are suggested in place of the proposed Treasury Rating Rule, and as more likely to be accepted at the present time than would any scheme of taxation involving a revision of the whole of the 'carriage duties.' The Auto Cycle Union would, however, take this oppor-

tunity of urging the early reconsideration of all such taxes, and would strongly recommend a merely nominal tax—for statistical purposes—on all horse-drawn or mechanically-propelled vehicles without exception, coupled with a tax—for revenue purposes—based on ton-mileage, e.g., a petrol tax or a tyre tax."

This statement was reviewed in the *Westminster Gazette* of May 9th as follows: "The Auto Cycle Union is the only organisation which has had the courage to tell Mr. McKenna the truth about it. In his statement the secretary (Mr. T. W. Loughborough) makes it clear that the formula is not a true measure of horse-power; that it has no relation to the purchase price of either new or second-hand machines; that it is inapplicable for technical reasons, and gives a very unfair comparison of horse-power between cars and motor bicycles; and, further, that it forces manufacturers to adopt one type of engine to the exclusion of other equally meritorious designs."

Furthermore, the services of an M.P. were secured to represent, if necessary, the views of the Union in debate. The following is taken from the Secretary's letter to this gentleman, dated May 25th: "I have been carefully considering the amendment to the Finance Bill which you suggested I should frame, and I have no doubt whatever in my own mind that the proper course the Government should pursue would be to delete Clause 11 in its entirety and to substitute therefor an increased tax on petrol."

It is probable that the action taken by the Auto Cycle Union in this matter directly influenced the Government to abandon the increased licence duties.

## Petrol.

Close touch is being kept with developments of this important question, and the interests of the private motor cyclist are being safeguarded as far as possible.

## Insurance Department.

The business done by this department has naturally been affected by the war, but in spite of the unfavourable conditions a considerable percentage of members continue to take advantage of the recommended policy, whilst over three hundred new members have this year availed themselves of the concession granted to full policy holders.

The particularly valuable arbitration clause in the policy has resulted in three disputes being submitted to the Union for settlement.

## Annual Handbook.

A supplement to the 1915-16 Touring Guide has recently been issued to all members. It was found impracticable to produce a 1916-17 edition of the Handbook on the former comprehensive lines, but the supplement will be

found to contain all essential information not comprised in the 1915-16 volume.

## Touring and Legal Departments.

The work of these departments, conducted for the Union by the Royal Automobile Club, has considerably lessened, particularly that in connection with touring. Approximately three hundred applications for advice as to routes, Customs duties, shipping, etc. (and these largely from members connected with the Services), have been dealt with, whilst there have been handed to the Legal Department about one hundred applications for free legal defence or advice.

## THE EASTING SIDECAR HOOD AND SCREEN.

**W**E have now had an opportunity of seeing and trying the Easting sidecar screen and hood in its finished state. A photograph of the screen alone and a sketch of the complete article were reproduced on page 14 of our last issue, but it was not till the middle of last week that Mr. Easting had the complete scheme in being. The front screen is formed slightly concave, and is supported on brackets in such a manner that it may be swung to one side to allow of easy entrance to the sidecar. The screen alone affords excellent protection from the wind, and during our run no difficulty was experienced in lighting a cigarette while travelling at 20 m.p.h.

With the celluloid side panels and waterproof top an absolutely stormproof sidecar is obtained. We found that when entirely closed the body was quite comfortable, though communication with the driver was by no means easy. A good feature is that, if the weather is, not sufficiently bad to warrant the whole cover being fitted, one side panel only can be fitted, so giving protection on whichever side the wind is blowing.

Easting screen and hood for sidecars, which results in a completely enclosed seat for the passenger. The component parts are light and quickly put together.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Steam Motor Cycles.

Sir,—I am at present engaged in designing a steam motor cycle, and, having a large workshop in which I can work, would be glad to hear of anyone interested and willing to experiment with me.

F. BARTHORP.

[Letters addressed to Mr. Barthorp, c/o The Editor, will be forwarded.—Ed.]

#### The Consumption of Automatic Carburettors.

Sir,—I am glad that "Ixion" excepts the Binks three-jet from his remarks about being extravagant, as I use this carburettor on a 1913 Morgan (8 h.p. J.A.P.), and find it very economical.

After careful tuning I can obtain fifty-five miles per gallon, London riding, and can go dead slow on top gear, and also get a violent acceleration.

The jets used are 00, 3, and 6, which might be of some use to the readers of your excellent journal.

B. J. BESWICK.

#### The Cost of Running a Motor Cycle.

Sir,—I beg to submit a statement showing the total cost (running and otherwise) of a 1909  $3\frac{1}{2}$  h.p. motor cycle, which I bought in January, 1914, and sold again in January, 1916.

		Rs.	a.	p.	Cost per Mile in pence.	Mileage 10,000
Cost Price of machine		300	0	0		
Repairs	Bought at date	25	0	0		
New Inner Tube	of purchase of	10	0	0		
New Tyre	machine.	30	0	0		
Spare Parts, Tools, etc.		10	0	0		
Sidecar (for the last nine months only)		50	0	0		
		425	0	0		
Deduct Selling Price		410	0	0		
		15	0	0	0.0240	
Depreciation		87	11	0	0.1403	
Running Repairs (includes reboring cylinder, fitting new piston, bushes, etc.)		26	8	0	0.0424	
One New Tyre		18	0	0	0.0288	
One New Belt		133	6	0	0.2134	
Petrol (118½ gallons), Oil, etc.		34	0	0	0.0544	
Interest on Rs. 425 at 4% per annum		314	5	0	0.5033	
Total Cost						

The actual mileage was 9,957, but as this figure alters the total cost per mile by 0.0022 of a penny only, the mileage of 10,000 was taken for the sake of convenience.

I have included every item I can think of in order to increase the cost per mile to a figure nearer the average (say 3d.), but even then it is only just over a halfpenny. If the depreciation had been nearer the theoretical figure of Rs. 100, the cost would have been increased to 0.6633 pence per mile only.

PHUT-PHUT.

BOMBAY.

#### Prompt Satisfaction.

Sir,—Very often when reading your valued paper, which, by the way, took a great part in making me a motor cyclist, I have been struck by the complaints made in the correspondence columns regarding the treatment of customers by certain motor cycle firms. Can you find room for an appreciation of at least one?

I am a thoroughly satisfied rider of a Premier 1914  $3\frac{1}{2}$  h.p. machine, which I run regularly with a Swan sidecar, not a lightweight either. Some time since I sent the machine

down for an overhaul, and in assembling the back wheel a ball got in between the axle and hub, scoring them both badly, and the pieces of steel it scored off wore the cones and balls. I wrote the Coventry Premier Cycle Co., and they sent me by return a new axle, cones, and balls complete, apologising for such a thing occurring, but explaining how difficult things were in the labour way just at present. When I came to reassemble the hub I found the cups were also badly worn. Again I wrote the company, and then they asked me to send them the wheel and they would replace them and do all that wanted doing, and as the fault was theirs they would pay carriage both ways (which goes beyond their guarantee), and get the work done at once. I sent the wheel off on Monday morning, June 19th, and received it back on Thursday morning, June 22nd, put in proper order, even a broken spoke being replaced, and securely packed in a crate. In these days of grumbles and complaints and difficulties with labour, it is refreshing to meet a firm which carries out its obligations in so prompt a manner without any quibbling or bother, and I think some of the others would do well to take a leaf from its book. I may say that whenever I have written the Premier Co. for information they have always replied promptly, although I bought my machine second-hand. The usual disclaimer.

J. H. ABELL.

#### A Ha'p'orth of Tar.

Sir,—Just lately I had the misfortune to witness one, and take part in another, breakdown, which, with a little care and forethought in the construction of the respective motor cycles, should not have occurred. In both cases the frame had snapped near the junction of the tubing in front of, and of that immediately above, the engine. This tubing, which takes all the strain, had snapped like a carrot an inch below the joint.

I am assured by a practical motor engineer that for the cost of sixpence or a shilling the tubing concerned could be made sufficiently stout to withstand the road strain necessarily imposed upon it.

I do not think it would be fair to name the two makes concerned, as there are probably others equally as bad, but as a keen motor cyclist I regret that for the sake of a shilling or so a motor cycle should be made a danger trap on a rough road.

LUPUM HABEO.

#### Average Speed.

Sir,—I am amazed at the letter signed A. Collings in last week's issue of *The Motor Cycle*. Mr. Collings says that he rode from London to Pontypridd, 176 miles, in 6h. 10m.; that is to say, at 29 m.p.h. on the average, and, of course, a good deal faster than that in parts of the journey. It is plain, even to one who knows but little about motor cycling, that the danger of accidents, resulting sometimes in injury to limbs, sometimes in death, varies directly with the speed at which motor cycles are ridden. It is also plain that in order to make it certain that motor cycle riding should cause no bad accidents the riding of motor cycles would have to be stopped altogether. If the speed limit were 8 m.p.h. it is as certain as a thing of the sort can be that during the year at least one child would be run over.

The makers of our laws in their wisdom, or folly, have said, "We will do away with the old law which forbade the riding or driving of machines impelled by any power excepting human muscles on the high roads, but, as the introduc-

tion of mechanically driven machines brings in a new element of danger, and as the danger is greater the more quickly these machines go, we do it on condition that they shall never go more quickly than 'n' m.p.h." At present the law has fixed "n" at 20. If a man rides at more than 20 m.p.h. he is breaking the law, and he is making it a little bit more likely that he will kill or injure some child or someone who suddenly comes into the road from an unsuspected cross-road, or some man on a walking tour who has lain down by the roadside to rest during the heat of the afternoon, and jumps up awakened by the noise of the car, and is maimed for life before either he or the man with the car can say "Jack Robinson."

Of course, none of these sad things do happen to the great majority of those who habitually break the speed limit, but they *do* happen now and then. And what I want to ask Mr. A. Collings and a host of other motor cycle riders is, "Is it quite *honourable* to break the law when it does not please you to observe it, when all the time you are taking advantage of the fact that the law has been altered so as to allow you to ride a motor cycle on the highway at all?"

WILLIAM THOMPSON.

Sir,—I have just been reading a letter by Mr. Osborne Blythe in your issue of April 13th.

I see he is most emphatic in his disbelief that an average of 45 m.p.h. is possible in England. He is, I imagine, the owner of an excellent touring machine with touring bars. Personally, I wouldn't risk my neck riding any machine without semi-T.T. bars at anything like speed.

I would like to mention a few averages I have done. I don't expect Mr. Blythe to believe them, or anyone else for that matter.

I remember when I was a cadet at Sandhurst in pre-war days doing the fifteen miles from Brooklands to Sandhurst, most of which is along a winding lane bordered by high hedges, in alarming time. I had half an hour to get back and parade for a French examination. I was in my seat in the hall on time, but my hands trembled so that my writing was not good. The machine was a racing Rudge—a beauty.

Another time I rode from Sandhurst to Lichfield with a passenger on the carrier in six hours. We stopped for lunch, after which we had a stroll at Henley, and at Coventry I went to look up my brother who was in the Daimler works, and had tea with him. With the same passenger I rode from Lichfield to Holyhead, non-stop, in under the four hours. The machine was a T.T. Rudge Multi, 500 c.c.

I have a road racing 7-9 h.p. Indian now which I have tuned up. I lightened the pistons in the usual way, and also removed the baffle plate of the front cylinder. The other night, bright moonlight, I rode 90½ miles over the road in 1h. 34m.

I might point out that here (India) the roads are practically dead straight and quite open; in short, when they are clear, as they are at night, it is track riding, and one can go all out.

I did this time for a bet, and was timed by two friends, over the Sialkit-Lahore road.

I wonder will one of your readers credit this?

SIALKIT, PUNJAB.

J. TIDMARSH, Lt.

#### Fast Stretches.

Sir,—*Re* fast stretches, I notice that "B.A.T." says there are only two corners on the Cambridge and Newmarket road that a car cannot take at 60 m.p.h. Has "B.A.T." any idea what 60 m.p.h. is really like round even the slightest corner in a car?

If "B.A.T." were to think a little more, he would find that there are at least *six* corners or bends in the said road that a car could not possibly take at 60 m.p.h.

RUDGE.

#### Piston Tap or What?

Sir,—I have had the same trouble with my 1912 Triumph. When going over 35 m.p.h. it started tapping, as though it had a loose gudgeon pin, and then slowed down to ten miles an hour, and would not climb a small bridge.

After examining the engine, and finding nothing loose or broken, I fitted a new plug, which stopped all the tapping, and the machine will now go any speed and up any hill without trouble.

A. GOMERSALL.

#### Petrol Waste.

Sir,—Having seen several letters in your excellent paper on petrol wastage, I am writing to point out what seems to me to be a very unnecessary use of the precious spirit.

I refer to the number of motor omnibuses which one sees standing in the approaches to London railway termini with their engines running, in some cases at quite a high speed.

Two examples I have in mind are those of Victoria and London Bridge stations, where there are seldom fewer than eight 'buses standing, and frequently many more.

Surely it would not be a great hardship for the drivers to switch off when arriving and start up again when ready to go, and so save a very considerable amount of petrol.

ERIC E. HART.

#### A Silly Act.

Sir,—On the Chester Road near Stonebridge I was resting by the roadside when three testers came along on two-stroke machines. The leader looked curious in the distance, and seemed as if his hat were over his face. To my surprise, he was riding backwards, his handle-bars behind him. He nodded to me as he passed at 20 m.p.h., and that threw him out and upset his balance. His bicycle ran up the bank, down again, and wobbled across the road, and the rider, evidently forgetting his position, tried to steer his back wheel, and ran up the opposite bank. No damage was done, although he narrowly escaped being run over by his two companions. He then rode to the top of the hill, turned his machine, got on again backwards, and came blinding along at, I should think, 25 m.p.h.

O 5036.

[We publish the above letter, not because we share our correspondent's admiration for the rider referred to, but because we hope it may be a warning to others to avoid such pernicious practices. The rider endangered not only his own neck, which may be of small consequence, but also the life and limbs of anyone who might have been using the road in a proper manner. We trust that the police will rigorously put down dangerous driving of this kind.—Ed.]

#### Spring-Frame Design.

Sir,—Being a motor cyclist and reader of your valuable paper for over eight years, I thought the following particulars of my spring frame would be of some interest to you.

Having an old Minerva 2½ h.p. machine at my disposal, I decided to try an idea, which I have since protected. The main engine and back wheel work together, pivoting in front of the engine and preventing any uneven tension on the

An old machine that has been fitted with a spring frame. See letter from Mr. Herbert O. Troman

belt. There is no knee movement, body and limbs moving together. Flexible petrol and oil pipes are fitted, and when only three bolts are removed the working parts are free from the rest of the frame for grinding valves or any other repair. I have ridden the machine for the past four months, very often with my brother on the carrier. It has proved very satisfactory.

HERBERT O. TROMAN.

## EXTINCTION OF A DARTMOOR HAIRPIN.

The New Road at  
Holne Chase,  
near Ashburton.

(1) The hairpin corner which  
has been done away with.

(2) The newly cut road on  
the right of the bridge.

(3) The old road, now blocked,  
and the new road on the left.

The numbers on the illustrations correspond to the numbers on the map reproduced below.

**T**O motor cyclists Ashburton is perhaps the best known of the principal "gates" to Dartmoor.

It is on the main road from Exeter to Plymouth, and has figured in many of the long-distance reliability trials. The town has a long and interesting history, and in 1285 was made a Stannary Town in connection with the Dartmoor tin industry—that is, a town where the miners had their tin weighed and a sort of hall-mark affixed. The other Stannary towns were Chagford, Plympton, and Tavistock. The brothers Lysons, who wrote their *Magna Britannia* in 1822, state "that there had been nothing peculiar in the government of Devonshire as a district from that of the rest of the kingdom, except that of the Stannary Laws, which have been in force from an early period in the mining district in the south-west part of the county." The Stannary parliaments were at first held in the open air upon an elevated spot, about six miles from Ashburton, known as Crockern Tor. "Till within the memory of man the commission was opened and the jurors sworn upon this spot, after which the court was adjourned to one of the Stannary towns." In later centuries Ashburton was an important wool centre.

The town contains an ancient grammar school and a church, said to have been founded in

1137. The present building, which includes a fine tower 90ft. in height, dates from the fifteenth century, with some remains of earlier work.

These objects are easily missed by riders of the present day who just "pass through," and to a casual observer there does not appear to be much of interest in the town. The most noticeable object is a large golden lion above the portico of the principal hotel, which catches the eye on the near side as soon as the main street is entered. Another sign, not nearly so obvious, is a small equestrian figure on the ridge of an old house on the opposite side. This was the sign which interested travellers in the seventeenth century. During the Civil War it indicated a safe refuge for the Cavaliers of the army of Charles I. Whether or not these curious little signs were ever numerous does not appear to be known. Another remains at Totnes, eight miles further along the main road, and one still exists on a fine Elizabethan house at the top of Exeter's steep Fore Street.

But it is doubtful if the competitors in the Jarrott Cup and similar events gave much thought to antiquities as they passed through Ashburton; what most probably occupied their minds was the knowledge that about two miles distant lay the local terror known as Holne Chase. In the

Sketch map showing new and old roads at Holne Bridge. Positions from which the three photographs reproduced above were taken are shown by the numbers.

**Extinction of a Dartmoor "Hairpin."**

days of fixed gears and less tractable engines than we now ride this was certainly a name with which to conjure. First a sharp left-hand turn over a narrow and concealed bridge, which spans the gurgling Dart, gave warning that something was doing, and before one had time to recover from one's surprise another left-hander swung one clear of the bridge and opened up a vista of about one hundred yards, apparently quite choked by a collection of all the motor cycle enthusiasts of the neighbourhood, to say nothing of their "crops" and female impedimenta lined along the hedges. A shout or a rattle above, caused by the failure of another competitor, gave warning that Devon's most notable "hairpin" was at hand, and almost before you realised it you were foot slogging around its 1 in 3 gradient; with a bit of luck you struggle round and up, up, you go only to come to grief a few hundred yards further on, when your hot engine positively jibs at a still steeper specimen of a typical Devon main road.

Those competitors who were compelled to make several attempts at this bit of the course probably carried away some recollections of the beauties of this delightful spot, and will perhaps recognise it from the accompanying photographs. They may also experience a difficulty in finding their bearings. The fact is the erstwhile terror has been superseded by a broad, almost flat road of no "negotiable" interest, which bears to the right after crossing the bridge.

**The New Road.**

Since those days of real excitement, when machines called for actual skill in driving, the mechanical engineer has provided gears, clutches, and engines capable of making fun of the gradients and twists which at one time inspired us with real terror. Consequently Holne Chase has been deprived of much of its interest. Nevertheless, many will regret that the hand of the improver has been let loose on such an old friend. True, the hairpin still exists, but its terrors are "preserved"—like the best fishing. As will be seen from illustration No. 1 a gateway is in course of erection across its mouth. No. 2 shows the alternative road which has been cut on the right-hand side of the bridge, and No. 3 shows where this new road debouches on to the old. This also is blocked by a gate bearing the legend "Private road"—second only in its aggressiveness to the sign "Trespassers will be prosecuted." The corners of the bridge have also been eased: improvements which will undoubtedly appeal to the "scorcher" and the drivers of "peregrinating drawing rooms" with 15ft. wheelbases, but the alterations will be regretted by lovers of the picturesque and by many an old competitor. Some compensation is, however, gained in the fact that the new road, which has been well carried out, promises to be very pretty, and it certainly opens up a charming view of the River Dart as it tumbles and foams along over the granite boulders which in vain attempt to obstruct it in its scamper to the sea.

**FIRST TRIAL OF THE YEAR IN  
THE CAPE PROVINCE.**

SCENES IN THE SEVENTY MILES  
RELIABILITY TRIAL HELD BY  
THE CAPE PENINSULA M.C.C. ON  
ASCENSION DAY.

(Top) J. F. Smuts (3½ h.p. P. and M. sidecar) leaving the lunchcon control. (Left) Different ways of tackling a drift. (Right) The winner, J. Roylowski (6 h.p. Enfield sidecar), passing the timekeeper at the summit of test hill. Second and third places were secured by W. McFarlane (6 h.p. A.J.S. sidecar) and G. W. Prillewitz (6 h.p. Enfield sidecar) respectively. McFarlane is shown pushing his machine through the water on the left.

## QUESTIONS

## REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Registration Fee.

**?** I have been charged £1 for the registration of a motor cycle and sidecar. Would you please inform me if this is the proper charge, as I was under the impression the registration of a combination was the same as for a motor cycle, i.e., 5s.?—G.E.B.

The proper charge for the registration of a motor cycle is 5s. The sidecar is not to be counted; you cannot register a sidecar.

## Licence for Motor Cycle used for Business.

**?** My wife has an Auto-wheel. Is it necessary for her to pay a licence if she has her name, business, and address on the machine? She is an enquiry agent for a firm of furniture dealers, and uses the motor entirely for business.—E.L.

There is no exemption for a machine of this kind. Exemption from the local taxation licence can only be obtained if a machine is used solely and entirely for the transport of goods and merchandise, and is fitted with a box for this purpose, on which the owner's name and address are painted in letters not less than one inch in height.

## Driving Hints.

**?** I should be grateful if you would reply to the two following questions, since as a novice they have puzzled me considerably.

My machine is a 1916 model 5-6 h.p. twin combination with three-speed gear box. (1.) Running down hill with the throttle closed and the engine in top gear, using the compression of the engine as a brake, when the machine slows down at the bottom can I open the throttle on the top gear, or must I change to a lower gear? (2.) When in traffic, will it hurt the machine to use the foot brake to slow up, or must the brake be used only when the clutch is out?—E.W.V.

1.) It all depends upon the speed at which you are travelling. If you have slowed down to the speed at which the second gear should be engaged, then you should drop into second. If, however, you have not slowed down too much, merely open the throttle, perhaps ease the clutch as you do so to take some

of the strain off when picking up speed. (2.) It is better to shut off the engine and apply the foot brake or ease the clutch. You might close the throttle and then apply the brake without taking out the clutch until the engine has been brought to that pace at which it would be naturally running according to the degree of throttle opening. What we mean is that if you shut off the throttle suddenly the machine will continue to run for some distance before settling down to the speed obtainable from that particular degree of throttle opening; therefore you may use your brake so as to decelerate the machine more rapidly.

## IMPORTANT NOTICE.

## GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILLIFFE & SONS LTD.

## Long Induction Pipe.

**?** The carburetter on my 1913 twin being worn out, I have had fitted a new 1916 model of the same make. This being bigger and of different design it could not be fitted close up to the induction pipe, which had to be provided with an extension, with the result that the jet is now about 7in. from the junction of the induction pipes. Using a No. 29 jet as before, I find that now (1) I cannot get slow running. (2.) It will not take more than half throttle, even with all air shut off. Would you tell me if these phenomena are due to the distance between the jet and the induction pipes, and if so, whether they can be cured by a larger jet—say No. 32?—D.J.

(1.) We do not think that fitting the carburetter so far from the engine has the effect of preventing the petrol from vaporising properly. We should, however, recommend you to try the effect of a warming pipe fitted with a funnel-

shaped end, taking hot air from one of the cylinders direct into the carburetter. It might also be advisable to try the effect of the next size larger and the next size smaller jets. (2.) It is seldom possible to open the throttle half way without opening the air lever to suit. Indeed, if it were possible, the carburetter would be out of adjustment and a smaller choke required. The latter would effect easier starting.

## Running on Paraffin.

**?** Now petrol is such a price I shall be glad if you will tell me what alterations (if any) are required in order that I may use paraffin. I use a Senspray carburetter with a 27 jet.—C.A.P.

To get a motor bicycle to run really well on paraffin is a difficult matter. The great thing to do is to get the paraffin to vaporise as well as possible. The vaporisation can be aided by fitting a funnel close up against the radiating fins and conducting the hot air obtained therewith direct to the fixed air intake to the carburetter. This helps matters a little. The engine, of course, must be started first of all on petrol, as, until warm, it will not run on paraffin. Unless the combustion is perfect, there is an excess of carbon deposit, fouling of the valves, subsequently causing pre-ignition. Also it is well to lower the compression.

## Belt Slip in Wet Weather.

**?** Will you be so good as to tell me a real cure for belt slip in wet? On Saturday I had to ride fifty miles in heavy rain, and could only dodder along at 12 m.p.h., because the engine raced under more throttle. I wiped the belt several times, but it was not until the rain stopped after forty-five miles that I could do anything like the usual pace. The belt was properly tight and the proper size for the pulley. It is just when it is wet and you really want to move that this annoying thing happens. Can you help me?—C.A.C.S.

If you use a rubber belt the only remedy is to shield the belt from the wet, unless you are prepared to fit a large counter-shaft pulley. Of course, in wet weather rubber belts are notoriously bad in this respect, and if you ride in all weathers it is better to have a leather belt to use on these occasions.

**SPECIAL NOTICE.**—Copies of this journal may now only be sent to neutral countries in America and Africa & posted direct from the office of the publishers or by newsagents who have obtained permission from the War Office, as in the case of neutral European countries. The publishers of THE MOTOR CYCLE have obtained the necessary permission and, consequently, can post copies for subscribers as usual.

**Overheating and Knocking.**

? Will you please answer the following questions about my  $3\frac{1}{2}$  h.p. machine, which is of recent date: (1.) Why, when I start out with sidecar and passenger, is it that the machine goes excellently for about two miles; but then begins knocking violently, sometimes even knocking until it stops, regardless of the position of the ignition and air levers? The compression is excellent, and the machine has only run about 300 miles since the cylinder and piston were cleaned. Do you think this might arise from worn bearings? (2.) How is the ball bearing secured on the pulley-shaft, and how is the other secured in the timing gear side of the crank case? What means should be used to get the one off the shaft, and the other out of the crank case, as I have tried to remove them, but did not use much violence lest I should break something? —A. READER.

(1.) Your trouble sounds like overloading, due to the use of too high a gear. It is likely that the machine is suffering from pre-ignition, which may be due to over-oiling having caused excessive carbonisation, or to the use of inferior quality oil, or to the use of a plug the points of which project too far into the cylinder. Thin electrodes invariably heat up quickly. (2.) The ball bearings are a driving fit on the shaft. The best way is to hit one off with a piece of brass and a hammer. The crank case must, of course, be divided.

**Carburettor Adjustment.**

? I shall be obliged if you will give me your advice on the following trouble I am experiencing with my 1913 model  $3\frac{1}{2}$  h.p. If the throttle is more than half opened the engine starts misfiring at once. This engine never did run with the air lever more than half open, due to the carburettor having extra holes for racing purposes, with a full size jet (40). The magneto is apparently in perfect order and clean, while the contact breaker is clean and the points are properly adjusted. A new plug has been fitted, and the carburettor thoroughly cleaned. The trouble has only recently appeared, since the cylinder has been rebored, a new piston fitted, and the compression raised slightly by fitting a flat-topped piston instead of a concave-topped one (this was done by the makers). The machine starts very easily, and runs well slowly; the only trouble being that it misfires with more than half gas, in spite of any adjustment of the air lever. —E.A.W.

The alterations to your engine may have upset the carburettor adjustment. You should, therefore, experiment with different sized jets until you get better results. The carburettor should stand the throttle being fully opened. It is just possible that the present jet is too large. As a matter of fact, misfiring on opening the throttle is usually due to an impeded flow of petrol. We take it for granted that you have ascertained that the petrol feed pipe and carburettor passages are clear. You might also make sure that both your valve springs are in good condition.

**Economy.**

? I am greatly puzzled at the high petrol consumption (50 m.p.g.) of my  $3\frac{1}{2}$  h.p. Triumph and sidecar combination, fitted with a Sturmey-Archer hub gear. Most of my riding is done without a passenger, and last winter the consumption got as bad as 40 m.p.g., but after careful tuning, etc., I have only succeeded in getting 100 to 110 miles from a can of Taxibus. During the last 200 miles I have been working with a borrowed cylinder piston and carburettor, but find the results still the same. My top gear used to be  $4\frac{3}{4}$  to 1, then  $4\frac{1}{2}$  to 1, and now is  $4\frac{1}{4}$  to 1, and I usually ride at a comparatively low engine speed, giving very little extra air, although on hills I lower the gear, increase the engine speed, and am able to give half extra air without knocking. Now some people advise me to lower my top gear nearer to 5 to 1; others say that lowering the gear will make matters worse. I have tried a smaller jet, but find loss of power, and a larger jet made matters worse. —H.G.

If you want to reduce your petrol consumption give all the air the engine will take and keep the petrol level fairly low. We think you would get the best results with a gear of  $4\frac{3}{4}$  to 1 or even 5 to 1. Generally speaking, you cannot get economical running except by fitting a smaller jet, which entails loss of power. The only thing to do is to effect a compromise somehow—that is, lose some power and use less petrol. Also look carefully for petrol leaks in the tank, pipes, or carburettor. A little paraffin mixed with the petrol will help you to discover these.

**EXPERIENCES WANTED.**

"T.L.C." (Cranwell).—Wooler. Petrol and oil consumption, reliability, etc.

"G.H." (Gateshead).—Suitable jet sizes with a Binks three-jet carburettor attached to 8 h.p. twin J.A.P. engine.

"C.S.W.R." (Melton Mowbray).—Suitability of Searle unburntable inner tubes for motor cycles.

**RECOMMENDED ROUTES.**

OULTON BROAD TO OLDHAM.—R.E.G.

Oulton Broad, Loddon, Norwich, East Dereham, Swaffham, King's Lynn, Long Sutton, Fossdyke, Swineshead, Sleaford, Leadenham, Newark, Ollerton, Worksop, Sheffield, Ashopton, Glossop, Stalybridge, Ashton, Oldham.

BLETCHLEY TO ABERYSTWYTH.—H.C.

Bletchley, Buckingham, Aynho, Deddington, Chipping Norton, Moreton-in-the-Marsh, Broadway, Evesham, Worcester, Bromyard, Leominster, Kington, New Radnor, Rhayader, Llangurig, Pont-erwyd, Aberystwyth.

FARNBOROUGH TO LEEDS.—A.P.

Farnborough, Bagshot, Ascot, Windsor, Slough, Beaconsfield, Amersham, Chesham, Tring, Dunstable, Westoning, Ampthill, Bedford, Eaton Socon, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, near Pontefract, Leeds.

BRISTOL TO CARLISLE.—J.E.T.

Bristol, Alveston, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Wellington, Whitchurch, Tarporley, Warrington, Wigan, Preston, Lancaster, Kendal, Penrith, Carlisle.

CARLISLE TO BOURNEMOUTH.—J.E.T.

By the route previously given as far as Gloucester, then go through Stroud, Nailsworth, Swainswick, Bath, Beckington, Warminster, Longbridge, Deverill, near Shaftesbury, Blandford, Wimborne, Bournemouth.

LONDON TO DARTMOUTH.—H.W.S.

London, Kingston, Esher, Cobham, Ripley, Guildford, Hog's Back, Farnham, Alton, Alresford, Kingsworthy, Winchester, along the Southampton Road to Bassett, turn right by a pond for Shirley, continuing through Totton, Cadnam, Ringwood, Wimborne, Bere Regis, Dorchester, Bridport, Lyme Regis, Colyford, Sidford, Exeter, Chudleigh, Newton Abbot, Torquay, Paignton, Kingswear, Dartmouth.

EXEMPLIFYING THE PUBLICITY VALUE OF A SMART SIDECARRIER.

A Lea-Francis machine with an attractive body used by a Nottingham stationery firm.

While the leading variable gear, the STURMEY-ARCHER, is devoting most of its output to the army needs, there are a few points for ordinary motor cyclists to think over.

Consider the experience behind the Sturmev-Archer. For sixteen years we have been making variable gears. During that time we have found out a lot. All we have discovered in gear making is in the Sturmev-Archer of to-day.

Consider the care necessary in choice of metals. We have learnt what gives the best results. Consequently, there are no experiments to be tried on Sturmev-Archer customers. The choice of the right material counts for more than users might imagine. We KNOW.

Consider the huge plant necessary to turn out every gear in mathematical precision—for the tiniest, fractional variation will be a serious thing to the user. That plant we have, and therein lies one of the secrets of Sturmev-Archer superiority.

Consider the value of an established name and a guarantee behind every gear on which you can rely. We can't afford to run any risks with the Sturmev-Archer reputation. That is a guarantee of excellence which needs most and final consideration.

Meanwhile note the address:

**Sturmev-Archer Gears, Ltd.,

## READ!

### MY 3-PHASE JET DAMPING CARBURETTERS

have such perfect vapourising properties that they enable you to use fuel at 1/4 per gallon in 42-gallon casks, which you are allowed to keep on your premises. Your engine will tick over dead slow, and pull dead slow in traffic, yet give the full power. It is almost impossible to tell you are not running on petrol at 2/6 a gallon. It cannot damage your engine or soot it up, and makes Motor Cycling possible in these times.

I give you my personal assurance of the truth of what is stated above. Please send at once for full particulars of the carburetter, and also for my Treatise on Carburation, and terms of One Month's Approval Trial.

**C. BINKS, Ltd., Eccles.**

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## ASKING FOR IT

It is asking for trouble to challenge a Powerplus INDIAN on the open road. But ride one, and you will find that the controls are so beautifully simple and effective that, although power and speed can be had at will, the engine is equally responsive for slow running, and its docility in traffic such that it can be ridden with perfect safety by the merest novice.

## The Noise of Motor Cycles.

**A** FACT which one cannot fail to observe is that present day motor cycles are, with few exceptions, no quieter than they were a few years ago. The Government orders on the subject and the outcry against noisy machines prior to the war will be fresh in our readers' memories. As a climax to the general complaints, an Order was laid down that no cut-outs should be used on motor cycles, nor should the exhaust be allowed to enter the air without first passing through an expansion chamber. Where the Order failed, however, was in the introduction of the personal factor in determining a noisy or quiet motor cycle. It will be recalled that the Order leaves it to the police to decide whether a motor cycle is noisy or not, and as the opinions of policemen are widely divergent, it is not surprising that in some districts the utmost laxity prevails, whereas in others the police are correspondingly severe.

We have surely reached a stage at which a silent motor bicycle is not a difficult problem. We are possessed of magnificent engines, in which we can afford to sacrifice a small degree of efficiency in order to obtain silence of running. Our opinion is that nothing is more impressive or more likely to attract new converts to the pastime—when happier days return—than the sight of a practically noiseless machine flitting along the road. We realise that an absolutely noiseless mount might be a danger on occasion, though this point is, to our mind, greatly exaggerated. Cars which make no noise at all, and which occupy ten times the amount of room on a road that a motor bicycle does, and, therefore, constitute a much greater danger—if silence spells danger—exist in thousands.

The purpose of this article is to appeal to those motor cyclists who appear to take a delight in rousing the countryside to have a little more respect for other road users' feelings, and conform strictly to the letter of the law. If they fail to do so spontaneously, it is certain that it

will not be long before legislation of a much more severe nature will be introduced. It is, therefore, in motor cyclists' own hands to decide whether they will continue to ignore restrictions and use semi-open exhausts and silencer cut-outs and thus bring about stricter regulations.

## A Reduced Supply of Petrol.

**M**ANY of our readers have apparently misunderstood the work and actions of the Petrol Committee. The work of the Petrol Committee has been to find out how much petrol is available, and this has now been done. Motorists who were owners of motor vehicles actually in use were asked to fill in certain forms on which the amount of fuel in hand and the quantity required was stated. It was pointed out that if the forms were not sent in no fuel would be supplied to the motorist who did not comply with the request. Numerous readers of *The Motor Cycle* for reasons, some good and some bad, omitted to fill up and send in these forms, and now write to ask us what they ought to do, while others who are equally ignorant of the procedure have bought new machines since the order came into force. Our advice in both cases is that the motor cyclist should write to the secretary of the Petrol Committee at 19, Berkeley Street, London, fully and clearly stating his case, and enclosing a filled up form, and on no account omitting to mention the use to which he intends to put his machine. Petrol cards or tickets will be obtainable on August 1st, and will be available for six months in the case of medical men, four months in the case of commercial users, and three months in the case of private owners. Each licence will fix the quantity of spirit which the licensee may obtain per month, and the additional war tax (6d. per gallon) must be paid in advance. *We hear it rumoured that only 25% of the amount asked for will be granted.* Motorists, therefore, must not be misled by the incorrect statements in the daily press a day or two ago.

and so won the cham-  
pionship.

# Occasional Comments by "Ixion"

## Reliability.

Since 1916 opened I have driven various machines a total of just on 5,000 miles with no other troubles than periodic decarbonisations and a few sooted plugs, so far as honest road work is concerned. If I have experienced a few other troubles, they have been exclusively ascribable to experimental work with special trial fittings. I have neither had a puncture nor choked a jet, and I have grown so careless that I have not infrequently tackled a longish run without so much as a spanner and a spare plug, a belt fastener, or a tyre outfit on board. If these lines should happen to catch the eye of some whilom enthusiast who has spent the last five or six years in some unrideable colony, I wonder whether he will believe them.

## Enclosed Chain Drive.

I quite agree with Mr. H. M. Batten that enclosed chains are infinitely preferable to open chains. I should, however, add a very big "but," and my "but" should be taken as possibly a more valid reason for the common dislike of such designs than the isolated cases of broken chains jamming inside chain cases which Mr. Batten cites. It is that some chain cases on the market are of simply atrocious design. It is extraordinarily difficult to open them up for access to the chain, and usually more difficult to replace them. I have tested many kinds, and there are few on the market which I prefer to an open chain. The split cast aluminium case, which Mr. Batten votes for, is obviously the goods for the front chain, and ought to be universal. The designing of the rear case is the rock on which many makers encounter shipwreck.

## Belt-rim Brakes.

I never thought I should write a word against the belt-rim brake, and I may yet have to withdraw the hint I now offer. The belt-rim brake has always appealed to me as the simplest, most foolproof, most reliable, and easiest adjusted brake it was possible to apply to a motor cycle. But after years of aversion of the band brake, and even greater aversion of the concealed internal expander, I have been driving an external band of modern design, and it has proved a revelation. When I first needed it, I needed it very badly. I had foolishly counted on finding a lonely hill deserted, and was sliding down much too fast when I met a herd of bullocks, jammed between hedges on a very bad corner. I crushed on the band, expecting to feel the usual stagger of the hind part of the machine, and to experience something of a dry skid, possibly mild, possibly demanding much resistance on my part. Not a bit of it. The machine slowed down perfectly smoothly without a wobble or a protest. I held my pen in leash for a thousand miles, expecting chatter, glazing, or adjustment difficulties to crop up in due course; but so far they have not appeared, and as I ride other machines with belt-rim brakes "in between whiles," as the cumbrous colloquialism goes,

I have every chance to muse on the merits of the other type. I look like revising one of my sturdiest allegiances.

## Everybody Using Mixtures.

I made a long trip last week, and took the opportunity of consulting many garage owners on the fuel question. They testified that most motor cyclists now call for the petrol-paraffin mixture, and many who only kept a nominal quantity of paraffin in stock in the old days have laid in a big cask or drum of a high-grade brand. They agree that the north-country riders are specially fond of the mixture—canniness being a typical north-country virtue—and say that many Lancashire and Yorkshire owners used to demand paraffin before the war. A north-countryman informs me that he has used equal parts of petrol and paraffin for years on his Clyno sidecar outfit, but that the petrol now sold is not good enough to stand so large an admixture of heavy fuel, so he is fitting a Binks carburetter. For myself, I am going one better, and using Binks fuel neat, after starting and warming up my engine. By the way, I have a correspondent who is evidently an old Parliamentary hand, accustomed to resurrect bygone speeches of ministers against them; for he sends two of my paragraphs, one of which is a note on top feed carburetters, whilst the other describes how I unscrew my carburetter lid to insert the starting dose of petrol. In future I shall append a footnote to all my paragraphs, explaining that I have at present three machines in my shed, and ring the changes on seven different carburetters. Lest I be next attacked for unpatriotic extravagance, let me hastily add that two of the mounts are trade loans.

## A SERVICEABLE AND NEAT HAT FOR LADY MOTOR CYCLISTS.

This most becoming headgear is known as the Reta.

The upper illustration shows how it is worn in fine weather with the peak turned up and the back flap folded. In heavy rain the back flap and front peak come down and an elastic chin strap secures the hat firmly to the head. A lady reader who has tried the Reta hat is most enthusiastic about the neat manner in which it left her hair. It is sold by Mr. E. Harrison, 41, The Grove, Hammersmith, London, W.

## THROUGH FEMININE GOGGLES.

**M**OST lady motor cyclists' earliest experiences are obtained on a low-powered lightweight, and rightly so. After one is familiar with the driving and controls of the lesser machine one may captain a high-powered mount. I am, personally, no believer in tackling a 6 h.p. or 8 h.p. machine without first having well passed the initial stages. It is rash to trust to one's hand or foot finding the clutch when in a tight corner, or to trust to luck in an emergency. For the past week, thanks to the courtesy of Messrs. Humphries and Dawes, of Birmingham, I have had one of the open-framed O.K. Juniors at my disposal. The machine in appearance is most dainty, enamelled black and green with smart lines, the low open frame giving ample room for ordinary skirts. The tiny engine of 2 h.p. is fitted with an overhead inlet valve and Amac carburetter, while a two-speed gear box is provided. The detail work is remarkably good throughout, roomy foot-boards with raised ends to protect the boots, two really efficient brakes and wide comfortable handle-bars. Makers of ladies' mounts often make the mistake of fitting impossible upturned bars, which render the steering awkward and sometimes difficult. A priming tap to ease starting, should it be required, is fitted, and a well-made guard over pulley wheel and belt. The chain from the engine to the countershaft is also

## A TRIAL OF A LADY'S O.K. JUNIOR.

enclosed. I looked round the machine, noting these details with satisfaction.

### On the Road.

As there was neither handle nor kick-starter, I put the gear lever into the low position and ran a few yards to see what happened. The engine commenced to fire immediately, so pulling up I stepped across the tiny frame and paddled away with ease. For a hundred yards or so the engine misfired whilst I manipulated the throttle levers to find the correct mixture. This was soon determined and away we went, the tiny power unit firing merrily. I turned the machine in the direction of my favourite test hill, a gradient of 1 in 8, with a sharp curve at the bottom to prevent a rush. The engine ticked over at fifteen miles an hour for the lower part until the increasing rise called for the low gear, and on this we sailed easily over the summit. This was quite good for the baby engine, and the makers are to be congratulated upon placing on the market such an eminently suitable mount for the beginner—low, comfortable, and withal possessing so many practical features.

MAY WALKER.

[Details of the O.K. Junior were given in *The Motor Cycle* for May 18th, pages 467-8. The engine is a single-cylinder M.A.G., 64 x 77 mm. bore and stroke, 248 c.c.—Ed.]

On the road with a lady's model O.K. Junior. Note convenient position of change speed lever (left) and dress guarding (right).

## HINTS FOR BEGINNERS.

### TUNING THE POPULAR LIGHTWEIGHT TWO-STROKE.

(The previous instalment appeared in the issue of June 22nd, pages 576-577.)

#### Overhauling the Magneto.

Next transfer your attention to the magneto. The high-tension wire leads to a carbon brush, which in turn presses lightly upon a brass ring. The carbon brush is housed in a vulcanite carrier, which in some instances is screwed into the magneto casing from the outside, while with others it is carried inside one of the end plates. In the first instance, detach the high-tension wire from the magneto terminal, and then unscrew the vulcanite carrier, using the fingers only, as should pliers be used there is every possibility of a breakage. Now take a pencil and wrap a clean piece of rag round it, dip it in petrol, and insert it through the hole, and revolve the magneto by hand, pressing the pencil and rag down upon the ring while doing so. This will quite clean out any foreign matter that may be lodged there. Now, by lightly turning to the left, remove the carbon brush from its housing, and look at the end that was in contact with the ring, and if at all shiny pass a smooth file across it once or twice, or draw it lightly across a piece of fine emery paper. Now take a piece of rag and twist it round until it is small enough to pass inside where the spring and carbon brush go; this is brass tubing, and will be benefited by a wipe out with this piece of rag dipped

in petrol. Replace the brush and afterwards its housing by reversing the order of withdrawal. In the case where the high-tension wire is carried through the cover at one end, remove the two holding down screws, when the cover will become free, and can be lifted off. The carbon brush will be found inside the cover, and the procedure may be exactly

Sectional view of driven end of magneto showing arrangement of high-tension pick-up carbon brush and slip ring.

as before, except that matters are simplified owing to a greater amount of the slip ring being visible and much more accessible.

Now remove the contact breaker cover, when it will be found that in most instances the whole contact breaker can be removed by simply withdrawing the centre screw; having done this remove the carbon brush that will be found on the back and treat this as you did the other one, but before replacing attend first to any adjustment that may be necessary. To do this, first remove the rocker spring at one end only; this will enable the rocker to be lifted off. It will

then be an easy matter to pass a smooth file across the platinum points, and so remove any uneven places or pitting that may be there. Next examine the fibre block at the end of the rocker, and if this shows signs of wear it is very easy to renew it. First remove the old fibre and keep it as a pattern, and then procure an ordinary fibre brake block of the red variety as fitted in cycle brakes. Dry this thoroughly in front of a fire, especially if you suspect it of being damp, and when quite dry cut another to your pattern but slightly deeper to allow for the wear on the old one, then place it in position, seeing that it is a tight fit; when properly secured, finish off the part that comes in contact with the cam with a file or emery paper. This has been a complete success in my case in three instances. Having done this, it will be necessary to readjust the points; having replaced the rocker and spring, put the contact breaker in position on the magneto again, seeing that the centre or holding on screw is done up securely. Now revolve the shaft slowly until the rocker is lifted on to the cam, and by means of a magneto spanner screw up the adjusting screw until the platinaums are so far apart that the gauge on the spanner will just pass through, when you may screw up the locking nut, and all should be well.

Contact breaker and segment sleeve.

#### Timing the Ignition.

The magneto can now be replaced and timed. To do this proceed as follows: place the magneto upon its platform, but do not screw the fastenings up too tightly at first, as the chain will have to be adjusted; now retard the magneto as far as possible, turn the magneto shaft round until the platinum points are just about to open, next bring the piston to the top of its stroke, and then couple up with the chain, which should have previously been removed from the paraffin and wiped quite clean. Adjust the chain so that there is no slack in it, but avoid tightness. It is as well to turn the engine over until the chain has moved right round its length, meanwhile feeling the chain to discover if there are any tight places in it; if so, adjust the chain when in its tightest position, and then screw the fastening nuts of the magneto firmly home. Finally dress the chain with good lubricating oil and replace the cover. In the case where there is fixed ignition, the position I favour most is

**Hints for Beginners.—**

with the points about to break, and the piston within  $\frac{3}{16}$  in. of the top of the compression stroke.

The next item to receive attention will be the sparking plug. It will be as well to give this a good clean out by turning it upside down and pouring some petrol into it and working a piece of very thin wood about in all the crevices around the electrode; then shake out the petrol and see that the points are quite clean. With the two-stroke engine, I have had good results from three and four point plugs, but my best results have been obtained from the single point variety. Care must be taken that the points are not too far apart. For easy and quick starting I find the magneto gauge gives the best results; therefore I set my points so that the gauge just passes through between them; with this setting, provided other items are in order, one or two pulls of the back wheel will start the engine easily when upon the stand. Now replace the compression release after cleaning it.

**Carburetter Adjustment.**

Then as to the carburetter: this will require to be taken to pieces and thoroughly cleaned. If the carburetter is extravagant in petrol try the next size smaller in jets; this may be the means of economising and obtaining more power, but as no hard and fast rule can be followed with carburetters it is only by personal experimenting with different sized jets and varying levels that the best results can be obtained; but the main points to aim at are to use the smallest jet possible that gives even running, and to keep the level in the float chamber down as low as possible in conjunction with it. When mounting the inlet pipe on the cylinder place a brown paper washer which has been seccotined on both sides between the faces of the joint; this will prevent any chance of an air leak there. In placing the carburetter back again on the inlet pipe, see that it is perfectly straight, and placed across the machine as much as possible—that is, the float and jet chambers side by side, and not one behind the other, as when the latter is the case the

**PUBLIC SCHOOL BOYS AND "THE MOTOR CYCLE."**

Three Charterhouse boys who are keenly interested in motor cycle matters. Practical riding experience and the technical knowledge acquired by reading are the finest schools for prospective recruits in the mechanical sections of our Army.

The N.C.O.'s of E Company Heavy Section Machine Gun Corps at their training centre. Their names are from left to right: L.-Cpls. Smith, Herrick, Clegg, Williamson, Russell, Moulding, and Sgt. Maloney, on the cycle Sgt. Pye, and in the sidecar Company Sgt.-Maj. Smith.

level is constantly altering with the rise and fall of the road. Should any doubt exist as to the carburetter union being air-tight, this can be bound round with insulating tape. The petrol pipe can now be put on again, care being taken that the pipe is not bent in such a manner that the joints do not seat "squarely." Should this happen, a gradual leakage will take place.

**Don't Neglect the Bicycle Parts.**

It now remains to attend to the exhaust pipe and box. These should be dismantled and scraped clear of carbon whenever possible, and made perfectly "free," as anything tending to choke the exhaust will very quickly destroy power. It is an undoubted fact that most riders, even where they give attention now and again to their engines, etc., sadly neglect the bicycle, its bearings, and various fittings. This should not be the case. The overhaul should be made the occasion properly to clean out wheel bearings and re-pack the hubs with a suitable grease, grease being better than oil, as it prevents road grit entering the bearings. See that all cones are properly adjusted, while a touch here and there with enamel will save the appearance of the machine. Also give attention to the springs and axles of the front forks, and see that they are in good order and receiving the proper supply of oil. Examine the belt and remove any pieces of flint that may be found sticking in the sides; these will, if allowed to remain, cause very rapid wear of the pulley faces. The last item, but not the least, will be the tyres. First remove all small pieces of flint which can generally be found sticking here, as these will eventually work their way through if allowed to remain and cause a puncture, besides letting the water through and ruining the canvas. Attention to this point will probably mean many more miles in the life of your tyres. Afterwards fill up all small cuts with a good tyre stopping, following carefully the maker's instructions when using it. The overhaul may now be considered complete, and the first time the machine is taken on the road again it will be a joy to hear the healthy bark of a well-tuned engine, while its old power will be there once more. After an overhaul of this description it is really wonderful how much better a rider seems to understand his machine, so that he can detect by sound almost every alteration, also its cause, should the slightest derangement take place.

ALEC. W. STANBROUGH.

## Duplicate Clutch Control for Bradburys.

THE Bradbury Co. has designed a neat duplicate clutch control, which is to be fitted to all future Bradbury models. The handle-bar control, placed to the left-hand of the rider and operating by means of a stout Bowden cable,

Plan view of Bradbury clutch control.

remains as before, but in addition a pedal-operated control, placed conveniently above the right footboard, is now to be included. The two controls are quite independent, and in both cases the adjustment is extremely simple.

The photograph conveys a fair idea as to the working of the pedal controls. As regards the hand control, the only alteration made is in the securing of the Bowden cable at the gear box end, so that the nipple at the end of the cable cannot disengage from the clutch actuating arm when the foot control is in use.

The pedal is of sensible dimensions, and the rod from it operates a small disc, so that when the pedal is depressed the disc rotates one quarter turn. Inside the disc is a quick pitch thread mechanism, and when the disc is turned this thread comes into engagement with a corresponding thread on the small bolt passing loosely through the clutch actuating arm, so that the small bolt tends to draw the arm inwards. At the end of this

bolt are lock nuts by which adjustment is obtained.

The device has been thoroughly tested, and works well, and the duplicate control may certainly be regarded as a very desirable refinement.

Right-hand side of Bradbury power unit, showing combined foot and hand clutch control.

R.E. DESPATCH RIDERS IN EGYPT.

In sending us this photograph Cpl. A. C. Webb has given the names of the men together with the towns from which they come. This is very interesting, as the riders come from all parts of the United Kingdom and Overseas Dominions. The names are as follow, reading from left to right :

Back row : Cpls. Knott (Fulham), de Cunha (Calcutta), Marston (Leicester), Paterson (Glasgow), Lea (Leicester), Saunders (Southampton), Butler (Kingston), Partlo (Reading), and Hinchcliffe (Sydney, N.S.W.).

Middle row : Cpls. Thomas (Auckland, N.Z.), Clifford (Sunderland), Mattl-ows (Leicester), Webb (Coventry); Lt. Foster (Leeds); Cpls. Murgatroyd (Scarborough), Hess (Ayr), and Nicholls (Crouch End).

Bottom row : Cpls. Richmond (Chorley), Clydesdale (Belfast), and Neave (Salisbury).

## THE 2 $\frac{3}{4}$ h.p. DOUGLAS.

ONE-LEVER CLAUDEL CARBURETTER; NEW FORKS AND SILENCER.

The latest pattern 2 $\frac{3}{4}$  h.p. Douglas from the valve side.

Transmission side of the new Douglas.

WE recently had the opportunity of seeing the latest model 2 $\frac{3}{4}$  h.p. Douglas, which is so far greatly ahead of anything the Douglas firm has turned out. The machine, of course, is not ready for sale to the public, owing to the Government's call upon the Douglas factory, but some notes concerning it will doubtless be of interest.

As regards general outline, the machine remains very much the same, but there are numerous improvements in detail. The oil is delivered through a sight drip feed of totally new design, the oil dripping through a pipe enclosed in a casing of cup form, the interior of which is white, and so designed that the glass cannot be obscured and the drips can be seen under all conditions.

The little engine remains much the same as when we saw it on the occasion of our last visit to the works. The compression taps in the cylinders have, however, been discarded, as they were never necessary, for no one ever wants to inject to start a Douglas. The little tap on the top of the crank case is retained for cleaning purposes.

### An Automatic Carburetter.

The most striking change of all is the fitting of a Claudel carburetter made by the Douglas Co. under licence. The single lever is an improvement of untold worth. For many years we have experi-

mented with different types of automatic carburetters on this machine, some good and others only fairly so, but the difference in running and the improvement in flexibility were so great that

The latest spring forks, showing the grease cups on the spindle ends.

we were firmly convinced, and often stated, that the automatic carburetter was the carburetter of the future. It will be noted that air is taken in warm from the back cylinder. This is a most important item, which has been much neglected by many designers.

The footrests are now carried on separate lugs, so that in the case of one getting bent or broken it can be instantly removed and straightened, or replaced by a new one. The toolbags are worthy of special remark, being of large dimensions, and extending the whole length of the carrier. Straps take the place of fasteners, so that the toolbag is always secure, and there is no chance of getting the contents lost upon the road. The bags are, of course, enclosed in metal, and there is a separate compartment for spares.

The substantial mudguard is now carried well away from the saddle, so that there is ample clearance between these two points. The front mudguard has also been greatly improved by the addition of large valances. A weak feature in previous models has been the stand clip attached to the back mudguard, but this has been greatly altered for the better, and is now quite secure.

### Improved Spring Forks.

Not the least important improvement incorporated in this machine is the silencer, which is now merely an expansion chamber with a long exit pipe, fitted with a fish-tail end, which is carried well beyond the rear axle. The forks have been improved in the anchoring of the springs and the provision of stronger springs, while grease cups have been provided for every working part, which is certainly as it should be. Another good feature is the provision of a cover for the chain. The machine is, of course, fitted with a three-speed gear.

We tried the machine for a short time in traffic, and were immensely pleased with its running. We found that it could be ridden in a certain quiet square at eleven miles an hour on top speed without the engine missing, and we feel confident that this can be improved with a little further adjustment. On low gear the engine could be throttled down to such an extent that it was barely possible to balance the machine.

The one-lever Claudel-Douglas carburetter.

New Douglas lubricator and rounded tank.

# CAR OR SIDECAR?

A Comparison of the Methods of Control with the Advantage in Favour of the Car.

WITH a view to economy, there are probably many car owners who are contemplating giving up their cars in favour of sidecars. As the writer until recently was a confirmed carist, and has since had some experience of modern sidecar outfits, his impressions may be of interest to those in similar positions.

A car driver about to purchase his first motor cycle passenger machine is really much more difficult to suit than the absolute novice. This applies not only to the actual selection and equipment of the machine, but also to its care and driving. Excepting for what one may call "road-sense," the fact of having driven cars, say as the writer has done for the past ten years, is not going to help one in the least as a motor cyclist; rather the reverse. On the other hand, a car owner who has served his apprenticeship on a motor cycle will probably get on much better with a car than a novice. But this should not deter motorists from taking up the two or three-wheeler, because it is only a matter of time before one becomes as much at home on a sidecar as on a car.

## Good Equipment of Sidecar Desirable.

The former car owner will be well advised to buy an outfit the specification of which embodies as far as possible car practice. For instance, detachable wheels, three or four speeds, hood and screen for the sidecar, dynamo lighting, and foot-operated clutch are fittings that the writer would endeavour to have on any machine he was purchasing. Needless to say, all those enumerated are not absolutely necessary, but it is better to spend, say, an extra £25 on the first cost, and avoid disappointment later. Thus the writer assumes that the car owner is prepared to spend about £100-£120, and it should be stated that this article is written after experience with a couple of sidecars of well-known make, the first cost of which in each case was in the neighbourhood of £110. Some readers may ask what is the use of paying £120 for a sidecar when a good second-hand light car can be bought at a slightly bigger figure? To this the correct retort is that as regards running costs, taxation, and accommodation, the sidecar is undoubtedly the more economical.

## The First Drive.

If one has only been accustomed to driving medium-powered cars, the acceleration and hill-climbing powers of a 750-1,000 c.c. sidecar are very striking, and the former car driver should proceed very cautiously for the first few miles. On the method of clutch operation with which the outfit is equipped will depend mainly the manner in which the novice progresses on this first trip. Hand control only will be worrying, and if the

machine is so equipped the driver will be well advised to practise coming to a standstill, changing gears, etc., before occasions make such operations necessary. With a foot-operated clutch, or a dual control, one is perfectly happy. Another matter that will be found rather disconcerting at first is the two carburettor levers—one for the throttle and one for the air; likewise the ease with which the engine may be stopped accidentally! Mention of the engine reminds one that our former car driver will require a word of warning as to the inadvisability of running the air-cooled engine when the machine is stationary. Being so accustomed to running the water-cooled engine of a car for ten minutes or so in order to allow it to warm up before leaving the garage, the writer found it most difficult to avoid doing likewise with his sidecar. One feels that one has not the control over the sidecar as on a car, and one longs for an accelerator pedal and a hand throttle stop to prevent the engine stopping altogether.

## Steering and Clothing.

Regarding steering, it is only a matter of time before one becomes quite used to it. For the first few runs the sensation to the driver when he is well on the left side on an over-cambered road is rather uncanny. On the question of clothing, the car owner undoubtedly scores over the sidecarist, for, however well the motor bicycle may be mudguarded, on a long run overalls are necessary for the driver. The sidecar passenger is, of course, quite as well protected as in a car, and with a hood and screen special clothing is not necessary.

The feeling of exhilaration one gets after a run on a comfortable sidecar is quite absent after a car run, and this the writer considers is one of the charms of a good sidecar. Unless one can afford a high-powered car the three-wheeler is undoubtedly the thing. The modern car of less than 15 h.p. lacks that quick acceleration and capability of rapid hill-climbing that one obtains with an 8 h.p. sidecar.

In conclusion, the writer may say that the only difficulty he has had in changing over from a car to a sidecar has been in converting his wife to the charms of the latter. But even this has not proved insurmountable.

BLUEBEARD.

## THE EVOLUTION OF A PRIMING TAP.

(From "Motor Cycle Illustrated" of May 11th.)

## THE SIDECAR DE LUXE.

A Special Gloria Production, excellently Designed and beautifully Finished.

"THE sidecar is the most un-mechanical arrangement it is possible to conceive"; so say not only many owners, but even the manufacturers themselves: yet it has caught public favour. Until something as cheap to buy, as economical to run, and as handy, is produced, there is very little chance of it being aban-

similar material, is a fixture.

### Complete Protection.

With the hood and side screens in position the passengers are very efficiently protected without being in any way cramped. There is ample room in the body for the adult passenger at the same time as the front seat is occupied by a

### WEATHERPROOFNESS IN SIDECARS.

A luxurious Gloria sidecar attachment with extra child's seat in front. Complete protection from the elements is afforded.

doned for a long time to come. Whatever may be said against it, at the present time the tendency with all makers of sidecar bodies is to elaborate, improve, and generally endeavour to attract attention until, as is frequently the case, even the most severe critics are won over.

One of the most ambitious designs we have seen yet is a special attachment, unobtainable by the ordinary motor cyclist, but produced specially for Mr. R. A. Tomson, manager of the Gloria Co., of Coventry. This attachment represents quite the last word in sidecar luxury. It has a large double-seated body provided with a hood, curved front screen, and folding side windows. As will be seen in the illustration, in fine weather the hood is carried neatly folded down at the back, and the side windows drop into the side panels. The front screen, which is made of transparent mica or

junior. And yet the storage room is not curtailed, there being a lock-up trap in the back of the body and a large coach-finished box mounted on the back carrier. The springing of this model has been very carefully designed, the rear being supported on large C springs, with the addition of a special Gloria shock absorber, consisting of a short pivoted arm and an involute spiral spring carrying the wheel axle. The C

springs support the body, and the spiral spring carries the frame. The front of the body is carried on a flat leaf spring set crossways in the frame. The tubular frame is extremely substantial, as also are the four connections to the motor cycle frame. A stand for the sidecar wheel is provided.

The particular model which we illustrate was finished in a rich purple enamel, with pale blue band and gold lines; upholstered in a mottled blue leather, black leather hood, and

The Gloria sidecar spring wheel has been increased in efficiency by the employment of an extra involute spring at the top.

**The Sidecar de Luxe.—**

mahogany stained windscreen frames. This elaborate style, combined with a powerful motor cycle finished to match, formed one of the smartest outfits we have seen. To use an Americanism, "It is some sidecar."

Naturally, it is by no means a lightweight, the sidecar alone probably scaling 170 lb., but with a machine of suitable power this should be no drawback.

**A Gloria Motor Cycle after the War.**

The motor bicycle shown in our illustration is a powerful twin-cylinder three-speed chain-driven Gloria, a newcomer to the motor cycle world, of which, no doubt, much will be heard after the war. For months

the forerunner has undergone exhaustive tests, but, as it is still in a purely experimental stage, it would serve no useful purpose to describe it at this juncture, and it is useless readers troubling the Gloria Co. (which, by the way, is Government controlled) for particulars. Suffice it to say that three different types of twin-cylinder V-type engines have been tested under all conditions of road use by men who know what a good motor cycle should be like. We can promise our readers that the Gloria, when it finally makes its appearance, will be a remarkably fine production, embodying all the latest ideas, and quite in keeping with the excellent work for which the Gloria Co. is noted.

**SHEFFIELD MUNITION WORKERS TAKE WOUNDED SOLDIERS FOR A SIDECAR OUTING.**

A party of Sheffield motor cyclist munition workers entertained a number of wounded soldiers, fresh from the "great push," to an afternoon's outing into the Peak District last Saturday. They took tea at Bakewell, and, of course, stopped at Haddon Hall, immortalised by Dorothy Vernon.

## PETROL LICENCES.

### DRASTIC RESTRICTIONS AND MUCH UNCERTAINTY.

**R**UMOUR follows rumour with regard to the amount of petrol which will be allowed to private motorists. For instance, it was stated in the daily press on Monday that 80% of their requirements would be available. Unfortunately this view was soon proved to be far too optimistic, and it is probable that private owners will receive about one quarter of what they asked for. Private users will get less than commercial men and doctors, and the general reduction all round will be about 50%.

#### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

We hear that something like half the motor 'buses will be taken off the road, and possibly an equal proportion of taxicabs, while char-à-banc trips will be entirely abandoned, except for the transporting of munition workers.

At the present time it is almost impossible to buy petrol in many places, and this difficulty seems likely to continue until the issue of the petrol cards on August 1st.

The requirements of the Government amount to approximately 2,000,000 gallons per week.

## A MOTOR SKICYCLE.

A Natural Development of the Child's "Scooter."

**T**HE child's skicycle or scooter has long ceased to be a novelty, and has taken its place among the child's regular playthings, but any attempt to propel the toy by motor power takes it out of the reach of the average junior, and we are afraid that this invention will not obtain the popularity its forerunner had.

Cross section of the twin-cylinder engine and wheel, and also section through the wheel showing the turbine-like flanges through which the exhaust gases pass

Mr. Joseph Maina, of Brixton, London, is responsible for this novelty under patent No. 7,056, 1915.

He has incorporated the power unit, consisting of a twin four-stroke engine, *en bloc* with the front wheel. The two cylinders are placed vertically on either side of the wheel, and drive by a reducing gear on to the axle. Simultaneous firing by one plug in a combined compression space tends to simplicity. We presume the magneto is geared off the axle, but ignition, carburation, and lubrication details are not clear in the patent drawings.

The principal departure from the ordinary is the endeavour to utilise the exhaust to give extra power. The escaping gases are directed through vanes in the centre of the front wheel after the manner of a turbine, the intention being to add impetus to the already driven wheel, but we believe this idea has been experimented with before, and has proved to be a fallacy. The frame is similar to the usual skicycle, with refinements in the springing arrangements. A cylin-

The motor skicycle, the novel production of a London inventor, and reminiscent of the "Moto Frip" and the Max miniature, which in the past made a sudden appearance and an equally sudden disappearance.

drical petrol tank is carried on the steering column. The lower part of the frame is to be made to fold over alongside of the front wheel for easy storage.

Generally, the machine may be said to be efficiently designed, with the exception of the use of the exhaust to aid propulsion, but we are very dubious of it coming into public use.

It would be unreasonable, and even dangerous, to allow a juvenile free use of such a machine on the pavements, and

should it be confined to the roadway, the child runs a grave risk of being killed by other faster vehicles. No idea is given in the patent specification of the approximate size of the machine or the h.p., and even if constructed large enough for an adult it cannot be ridden in a standing position with any degree of comfort; but it is a distinct novelty, and any further developments on these or similar lines will be awaited with interest.

WOUNDED SOLDIERS' SIDECAR RUN IN THE NORTH MIDLANDS.

A party of soldiers from the Hooton Hall hospital were taken for a run to Worksop and the Dukeries, the picture showing the start. The organiser was Dr Pycroft, and many local sidecarists assisted in making the outing a success.

## "THE MOTOR CYCLE" RECRUITING SECTION.

INSPECTIONS of recruits for the Motor Machine Gun Service were held at the Coventry Recruiting Office on Tuesday, and in London (20, Tudor Street, E.C.) on Saturday last. The names of those motor cyclists and car drivers accepted will be found in the list given below.

Ballard, A. H., Berkhamsted.  
Brotheridge, A. T., Rodborough, Glos.  
Burke, H. C., Aldershot.  
Chandler, W. E., Lewes.  
Colombe, P. M. V., London.  
Cox, G. A., Cheltenham.  
Crossdale, F. W., Bristol.  
Danks, C. L., London.  
Eady, W. R., Wilby.  
Escott, A. J., London.  
Evans, M., Brigg.  
Forster, W. A., London.  
Francis, P. S., Broseley.  
Frank, S., Romford.  
Gauby, H., Brigg.  
George, F., Cerne Abbas.  
Green, L., Pontypridd.  
Harrison, W., Ryton-on-Tyne.  
Howkins, G., Coventry.  
Jelly, V., Guildford.  
King, W., Northrpe.  
Lee, F. J., Wellborough.  
Mariani, A., London.  
Meggs, A. L., Slough.  
Olley, C., East Dereham.  
Read, A. H., Brundall.  
Russon, G. W., Wellington, Salop.  
Short, A. C., Cerne Abbas.  
Stenhouse, A., Stirling.  
Summers, W., Honiton.  
Sutton, R., Newton-le-Willows.  
Tate, E., Richmond, Yorks.  
Waighell, W., Llanneston.  
Whittaker, J. H., Blackpool.

### Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Appointments with another group of candidates had been arranged for Tuesday this week at the Coventry Recruiting Office.

Readers having motor cycle or car driving experience and wishing to enlist in the M.M.G.S. should note the following particulars:

AGE.—19 to 40.

ENLISTMENT.—For duration of the war.

MEDICALLY FIT.—For general service abroad or for garrison duty abroad.

PAY.—Is. 2½d. per day, all found; the usual separation or dependant's allowance.

Men may attend any of the inspections without previous notice, provided they are ready for immediate enlistment if accepted, but it is desirable that all be examined by the Medical Board at the headquarters of their respective places of attestation beforehand.

It seems likely that the immediate requirements of the Motor Machine Gun Service will be satisfied at an inspection which has been arranged for Tuesday next, the 25th inst., at the Coventry Recruiting Office, between 2 and 4.30 p.m. Should the applicants exceed the vacancies existing on that date, a waiting list will be formed to meet future calls of the Commanding Officer.

A recruit accepted by Mr. Smith in London on Saturday last was born in the West Indies, and has lived there up till recently, when he paid his own expenses home to enlist.

### Royal Engineers Signal Service.

Men passed for the waiting list of the Royal Engineers Signal Service are called up much more promptly than in the past. A few months ago it was no uncommon thing for a man to be kept waiting three or four months, and even then have to enlist in some other section. Two readers passed by the Editor as despatch riders received their calling-up papers within a week.

For the benefit of prospective despatch riders, we repeat that new regulations recently introduced provide that men must be between 18 years 9 months and 35 years of age. Also the test now applied is much more stringent than formerly, only first and second-class men being accepted.

### AT THE TRAINING CENTRE OF THE MOTOR MACHINE GUN SERVICE.

(Left) The regimental band.

(Below) N.C.O.'s of the Ford battery. Mech.-Sgt. L. A. Bees (the former L.M.C. rider) on Triumph; Sgt.-Major Forsyth at gun; Sgt.-Driver Lightfoot driving.

Reg. Sgt.-Maj. Dowland  
on a B.S.A.

# A HARLEY-DAVIDSON DINNER.

Reception to Directors of a Leading American Motor Cycle Company.

ON Wednesday evening last week a reception was held, and a dinner given to various members of the motor cycle press and trade, to welcome the Milwaukee directors of the Harley-Davidson Motor Co., Mr. Walter Davidson, president of the company, and his colleague, Mr. J. A. Stone, at the Hotel Pagni, Great Portland Street, W. Previous to the dinner the company were entertained to a series of kinema pictures of events in which Harley-Davidson machines in London had recently taken part. There were shown the first two Harley-Davidson wounded soldiers' outings, starting from St. Thomas's Hospital, and finally the wounded sailors' outing.

## The Speeches.

At the conclusion of the dinner Mr. Duncan Watson rose to propose the health of His Majesty the King, whose portrait in the style of a cameo was situated over his head, tastefully illuminated by electric light, and surrounded by the flags of the Allied nations. Next the National Anthem was sung with deep feeling, and then Mr. John J. Withers, a director of the London company, rose to propose the toast of Messrs. W. Davidson and J. A. Stone. He had, he said, only to ask those present to drink the health of his friends from the United States. Good wine needs no bush, and he could add nothing to the lustre of their names. Their factory produced an extraordinarily efficient motor bicycle, and he hoped that they would turn out a still better one. It was really not a time to speak of politics, though politics formed a part of their lives at the present moment. There had been some talk of a premature peace, and he asked Mr. Walter Davidson to tell his friends across the Atlantic that there would be no premature peace, and that the end would only come when we were satisfied, and not before.

Mr. Walter Davidson, in reply, said that part of Mr. Withers's speech had affected him very deeply. He felt very strongly about this war. His people had been Scotch. The Milwaukee inhabitants, who were not all Scotch—(laughter)—had thought him mad for coming over to England, and thought he would meet with an untoward fate owing to submarines or Zeppelins. "Still," said Mr. Davidson, "we are here." He was pleased to be here, and thanked the chairman for the privilege of meeting so many good friends.

## Zeppelin Raids.

Mr. J. A. Stone said that as he looked round the room and saw the Stars and Stripes and the Union Jack entwined it brought back memories to him of early days. He was proud to see that English-speaking races were now keeping together. The Americans had been said to be "dollar-chasers," and they had no interests in the struggle save money. He was glad to say that there never had been a shadow of doubt where the sympathies of the majority of the American nation had been, and that there was a growing sentiment throughout the States towards the

Allies. What more could America have done? There was no nation more unprepared for war. English statesmen had received moral support and encouragement from across the Atlantic. This was his second visit. He was over here in August and September last year, and was in the thick of the Zeppelin raid on September 8th, and it brought the war home to him. Next day he saw the infinitesimal damage which had been suffered, saw its effect upon the English people, and said, "My German friends, all you have done is to provide England with more soldiers."

## Scotsmen.

Next followed the toast of "The Chairman" by Alderman Beaumont. "The chairman of the London company, Mr. Duncan Watson," said Mr. Beaumont, "is a Scotsman." That fact was evident by many signs; by his unnatural caniness, and by what had been flashed on the screen before the dinner. If a Scotsman saw a crack in the wall of circumstances he would get through, and what is more, would expand it and bring other Scotsmen with him. Mr. Duncan Watson was a good fighter and a hard fighter. He never hit below the belt, but he was a bad man to have against one. We were now happily in the possession of the truly benevolent neutrality of the U.S.A.

Mr. Duncan Watson then rose to propose the toast of "The Visitors." He thanked Alderman Beaumont, Ex-Mayor of Marylebone, for his words, and said that not only was he a Scotsman, but the American Harley-Davidson chiefs were Scotsmen too. Mr. Stone had come over last year to put a proposal before him which he had accepted, and he hoped now to associate himself with the Harley-Davidson Co. for some time to come. It was his duty to greet the members of the press, their agents, and other friends, the Mayor of Marylebone, the Town Clerk, and Alderman Beaumont. He had great pleasure in welcoming Mr. Otto Thomas. The body he represented had done much against the drastic form of taxation with which they had been threatened. He greeted Mr. Geoffrey Smith, Editor of *The Motor Cycle*, Mr. Pascall (Colmore Depot), one of their Birmingham agents, and Mr. Saylor (Goodyear Tyres), who represented the tyre industry.

In reply the Mayor of Marylebone extended a hearty welcome to the Harley-Davidson Co. on behalf of the borough, and hoped that it had come to stay. He had greatly enjoyed the remarks of Mr. Stone, and believed that all right-thinking Americans knew the Allies' cause to be the right one. He hoped that the Harley-Davidson Co. would stay and prosper, as it thoroughly deserved to do.

## The Work of the A.C.U.

Mr. Otto Thomas (Chairman the A.C.U.) stated that the Auto Cycle Union was doing its best to fight for the cause of motor cyclists, and to ensure an adequate supply of petrol. He was right in saying, as an example of what the Auto Cycle Union had done, that it had been responsible for the withdrawal of the

threatened taxation. It had done more; it had put forward proposals of a practical character. The Auto Cycle Union had done good work in recruiting, and one of its first considerations had been how to win the war, and it had become appointed the clearing house for recruits for the Royal Engineers' Despatch Rider Service. Furthermore, it created a body to look after men connected with the motor movement who had been injured at the Front, and would see that not one of these men would be in need after the war, but would always have a helping hand extended to him.

Mr. R. D. F. Paul said he did not know which to admire most, the business or the sporting side of the Harley-Davidson Co., but every credit was due to Mr. Duncan Watson, Mr. Masters, and Mr. W. Cooper. He welcomed the schemes that were evolved, and greatly appreciated what they had done, speaking in loud terms of praise for the wounded sailors' outing. He was glad that Mr. Walter Davidson had not, like most Americans, gone to see the beauties of England on a Rolls-Royce, but instead had started by taking an excursion into the country on the occasion of the wounded sailors' outing as a driver of one of his own sidecar combinations.

Mr. Hermalin said a few words on behalf of the Harley-Davidson staff in London.

## A "Silent" Baby (?)

Mr. Geoffrey Smith (Editor, *The Motor Cycle*) said how pleased he had been to meet men of this big company, who had had sufficient pluck and confidence in their productions to start business in a country which was in a state of war. That this confidence had been justified was shown by the fact that they had, to use an American expression, "made good." He heartily welcomed Mr. Walter Davidson and his colleague, and hoped to see them back again soon, perhaps with a Silent Grey baby—lightweight.

Mr. McKenzie, in the course of an amusing speech, in which he related his experiences in America, said that he considered that the Harley-Davidson machine was the nearest approach to British finish and British production he had yet seen in the U.S.A.

Mr. Pascall said that three years ago he had gone to the United States, and found them very backward in the design of motor bicycles. With the exception of one or two firms they were not nearly up to English standard. He thought that English influence had made the Harley-Davidson what it was to-day. "When he was in America two-speed gears were a rarity, and anyone who saw a sidecar thought he had made a discovery."

Mr. Saylor, speaking of the romance of the Harley-Davidson Co. and of its wonderful growth from a small beginning, said that its success had been due to three causes—concentration, co-operation, and confidence.

Mr. Duncan Watson then returned thanks on behalf of his directors and himself, and the proceedings terminated with the singing of the National Anthem.

# Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

## Petrol Lighting.

Sir,—Can you or one of your readers supply me with the address of a gasoline lighting outfit for motor cars? This fitment was British made, and, I think, used a mantle. I have read your most excellent journal for a number of years, and have found many valuable "tips" from your columns.

SIDNEY C. TRAVER.

Chicago, U.S.A.

## Paraffin as a Fuel.

Sir,—With reference to the illustration and description of my vaporiser that you published in *The Motor Cycle* on May 25th, you may be interested to hear that I have now covered about 1,000 miles on paraffin with splendid running results, and have taken the engine down and find there is very little carbon deposit, no more than if I had been using petrol. The bearings are in very good order also, which goes to prove that the paraffin is efficiently vaporised and is not getting past the piston rings and diluting the oil.

WM. BARNETT.

## The Motor Cycle in Australia.

Sir,—I should like, as an Australian officer, over here on Active Service, to correct some of the impressions which many of your Australian correspondents give of the conditions in that country. Anyone would imagine that we spend our motor cycling lives ploughing through deep sand and jolting over impossible humps; and that the English motor cycle is hopelessly inadequate for the work. The truth is that the average roads of Australia, while not good, are by no means so atrociously bad as some people say. I have ridden over many roads in England considerably worse than the Australian average. It is quite true that just round Sydney the main roads are as bad as can be, but in most other parts of New South Wales, at any rate, they are quite decent. For instance, I never had any difficulty in riding from Sydney to Leura—sixty-three miles and more than 3,000 feet high—in less than three hours on my little Douglas, and that included the dreadful fifteen miles of the Parramatta Road, the chief glory of the State.

As a matter of fact, the best English motor cycles are not only quite suitable for Australia, but are eagerly rushed after, and I have no doubt that there is now a waiting list as long as my arm for the two machines I know intimately—the Douglas and the Scott—to say nothing of the Triumph, New Hudson, etc. I have no patience with a fanatic who says that motor cycles should have no valances, or that the 4 h.p. Douglas fails there because some imbecile bent its footboard in trying to corner too quickly. I see many despatch riders who ride in far worse conditions than anywhere in the civilised parts of Australia, and they all tell me that the 4 h.p. Douglas is a most splendid solo rough-riding machine, and probably the best in the world. I only wish I could get one.

No doubt the American machines are at present monopolising the Australian market; but things may be very different after the war. I have yet to see any American bicycle that will give the constant runabout service of the little Douglas. It starts at a very slow walk, does 100 miles and more to the gallon, needs practically no looking after, never sideslips, and is, to my mind, at any rate, the most altogether lovable little machine on earth. And as for speed, I fancy the Scott will hold its own with most of the big Americans, and when a spring-framed Scott comes into being

it is going to be mine. I know nothing like the beautifully sweet smooth and silent dash of the Scott up hill.

At present the Americans are having everything all their own way over there, and I fancy that Australians may have perhaps forgotten how good the good English machines really are, but after the war I believe there will be a very different tale to tell. As to whether a spring frame is quite necessary on a little machine like the Douglas time will show. My present experience is that Terry's links, knee-pads, and a big Brooks saddle go far to avoid it; but I am quite willing to let Douglas Brothers decide for me in that respect. With powerful high-speed machines like the Scott, which storm up a 1 in 9 hill as if it were level, I am sure a spring frame is badly needed in Australia. One real grievance that we have is that the English firms appoint only one agent, in whose hands we are left like sheep in the shearer's. The result is that, in some cases, we have to pay an advance of 60% or more on the English list—not trade—prices, whereas, I believe, the cost of bringing out a machine to Sydney is not more than about £15 in normal times. I mention no names, because most of the principal agents are personally known to and friendly with me, but none the less the grievance is a real one, and the English makers will find the American competition pretty severe unless they are prepared to see that their machines are sold in Australia at a reasonable price.

C. MACLAURIN, Lt.-Col. A.M.C., A.I.F.

## A Tip for Rudge Riders.

Sir,—The following tip might prove helpful to Rudge Multi riders, and, incidentally, do much to lessen the prevailing fallacy that Ridges "eat belts." When changing up, close the throttle lever temporarily until the lever (gear lever) is in the desired position. (N.B.—Do not move more than three notches at a time at the outside.)

C. M. THOMAS, G.C., R.M.A.

## Sparking Plugs.

Sir,—Has "Ixion" tried the Reliance sparking plug? At one time I had a twin Rex 5 h.p., a.i.v., and the front cylinder always got too much oil which caused a lot of trouble with the sparking plug. After having tried several makes, with more or less the same result as described by "Ixion," I tried the Reliance, and was very pleased with the result. I am now riding a Scott, using the same make of plug, and so far have had no trouble, although I have used oil plentifully.

E. J. COPE.

## Binks Fuel.

Sir,—Re Binks fuel I am trying it with a big single Excelsior combination, and find it excellent. I inject petrol through the decompressor, and the engine starts at once. The running is unaltered, but the cost works out at rather more than 1s. 3d. per gallon. I only received thirty-seven gallons instead of forty-two (through leaky cask), and can get no compensation. There is also the carriage from Manchester and carriage of cask back. Thus:

Paid for forty-two gallons at 1s. 3d. ...	£2 12 6
Carriage both ways ...	5 0

Thirty-seven gallons cost ...	£2 17 6
(Nearly 1s. 6½d. per gallon.)	

H. J. DUNNE COOKE

### "As Docile as a Two-stroke."

Sir,—I thought perhaps these photographs of my Zenith would interest some of your readers. I find this machine very fast and powerful, and yet as docile as any two-stroke.

J.A.P. engine on the big Zenith, showing lever for operating the Zenith-Gradua gear.

The appearance is unique, the frame being French grey and the wheels black; thus another example of the cult of disc wheels. I think it an ideal machine for fast touring and competition work.

R. BRASS, Lr.

### "Spots" and Cheap Fuel.

Sir,—Like most other motor cyclists, I am rather interested in the cheap fuel question. Long before the war began I used to try various dodges to cut down the fuel bill. I tinkered with the carburetter until I got the lowest possible consumption consistent

with moderately good power. I have used only three makes of carburetter, i.e., Amac, Binks, and B. and B. single-jet model. The machine on which practically all my tests—if I may so call them—were carried out was a 596 c.c. single-cylinder with heavy coachbuilt sidecar attached. I did experiment a little with a 499 c.c. single, but that was without sidecar, and the experiments were confined to the use of various jets in the B. and B. carburetter, and to the use of pure benzole and benzole-petrol mixture. With regard to benzole, I may say that if I could at present obtain it I would never use petrol. My experience with it in three different engines was exactly the same, namely, more power and consequently greater mileage at a given speed, cooler and cleaner engine, and total absence of knock, except when severely overloaded.

My present mount is, as I say, a 596 c.c. single-cylinder fixed engine with Philipson pulley, heavy sidecar and a thirteen-stone passenger; I myself weigh eleven stone. This machine I found, on stopping and starting runs on ordinary give-and-take roads of fairly good surface, averages 75 to 80 m.p.g. on No. II. petrol, running at an average speed of 20 m.p.h. or thereabouts. Recently I tried a half-paraffin mixture, but the result was not very good. I admit I made no alteration to the carburetter, with the result that much of the paraffin was not consumed, and, of course, left the engine decidedly free when cold; I therefore stopped using the mixture after the first two gallons were consumed. I also tried "Spots" as directed, and to my mind the addition of "Spots" to petrol makes it as good a substitute as possible for benzole. Some may say that is a very poor recommendation, as there are many who dislike benzole, but I venture to say if these objectors give benzole a really fair trial they will be more than satisfied. Why I myself have a friend who would not use benzole on any account, simply because he once saw a seized piston, the machine being driven on a benzole-petrol mixture by a not too skilful driver. He admits the seizure might have occurred on pure petrol, and he also knows how my machine runs on pure benzole, but at the same time he will not use it.

"Spots," I find, give me more power for a given throttle opening, though I do not think the engine is any cleaner. Certainly the carbon is softer, but whether I get 25% greater mileage I do not know, as I have not been able to make a careful test just yet. I have used "Spots" for about 1,000 miles, wet and dry, on good and bad roads, and I can fully endorse what your correspondent, "Chief Consul, C.T.C.," says.

Recently I did a 95 miles non-stop run, with a 13 stone passenger and a large quantity of luggage and spares. I should say the load carried was about 28 stone—that is to say, myself, passenger, and luggage. About one-third of the road was of moderate surface, but was wet and had plenty of sticky mud; one-third dry and bad surface; and one-third dry and rather good surface. Several very stiff main road hills were met with, two of which were each over two miles in length. On this occasion I used "Spots," but my consumption, as nearly as I can calculate, went up to 60 m.p.g.; but opposite that must be placed the fact that I did the distance in 3h. 40m. I am quite sure I should never have been able to get up some of the hills on pure petrol. I know absolutely that there are several hills that the machine climbs with ease when "Spots" are added, but which took all my driving skill before such addition was made. Like "Chief Consul," I did not notice so much difference when I first used "Spots," but I certainly did notice a great change when on one occasion I "filled up" without them.

I cannot speak too highly of the Philipson pulley. It is a delightful form of gear, giving exactly the correct gear when it is wanted. Mine is fitted with an extra strong spring, so that it is only very slightly automatic in action, and then only on very heavy hills. I much prefer to do the control work myself. I use a top gear of 4½ to 1 for sidecar work, which is rather higher than is usual, but this, I find, is the most suitable gear for this particular engine.

I have not, so far, been able to obtain Binks fuel in small quantity, but when I do lay hands on some I will try it with the three above-mentioned carburetters; but at present I pin my faith to petrol and "Spots," and a B. and B. single jet with extremely low petrol level, and last, but not least, a Philipson pulley.

H.II.

### Hints for Beginners.

Sir,—I was much interested in the article, "Tuning a Two-stroke," in the issue of the 22nd ult.

May I suggest that it is a good plan to clean the outside of your 'bus before you take it down. "Shinie" is a grand thing for cleaning the ports and piston ring slots; you can get them beautifully bright with it. Oiling the piston ring slots is new to me. I do not think I have seen it in print before. Why are the joints in two-strokes made with seccotined paper and in four strokes nearly always with oiled paper? I think a good tip for a beginner is to leave his magneto alone if there is nothing wrong with it.

LIMIT GAUGE.

A high-powered solo mount de luxe—the big Zenith belonging to Lt. R. Brass.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Sidecar Attachment.

When attaching a sidecar to a motor cycle would it be advantageous to set it so that the motor cycle leaned very slightly away from the sidecar, or would it be better to set it so that the motor cycle leaned towards the sidecar (a vertical lean in each case)?—H.N.W.

In our opinion, when attaching a sidecar to a motor cycle, your better plan would be to fix it so that the motor cycle leans neither away from nor towards the sidecar, but perfectly vertical.

## Tyre Sizes.

(1.) Will you please tell me if a  $26 \times 2\frac{1}{2}$  in. tyre will fit a  $26 \times 2$  in. rim? I believe I have seen it so stated. (2.) Also will you please tell me the best way to take the stretch out of a new belt?—S.C.

(1.) A  $2\frac{1}{2}$  in. tyre will usually fit a 2 in. rim, if there is sufficient clearance in the forks. (2.) Hang up the belt with a heavy weight on it, and leave it all night. Or it may be fitted to the machine and stretched by applying pressure by pressing the lower portion down with the foot, turning it round a little and applying the pressure again, and so on. After which it will be found a considerable length may be removed and that most of the elasticity is gone.

## Testing for Clutch Slip.

(1.) I have a 1914 5-6 h.p. A.J.S. fitted with a countershaft three-speed gear. Is there any way of ascertaining by turning the wheel on the stand that the clutch has the right strain on the springs, and will the clutch slip more readily on top gear than on low? (2.) How many miles should a pumpful of oil last with sidecar and passenger? I give one every four miles, and my crank case, etc., is always covered with oil, so I think it is getting too much, but would like to be safe. (3.) How should the magneto be timed for sidecar use? I understand from what I read in your paper more than a year ago that when riding with a sidecar attached one should time one's magneto slower, so that one could nearly always ride with spark fully advanced.—S.M.

(1.) You cannot test the clutch for slip on the stand. You must take the machine out on the road and test it on a stiff hill. The clutch is more likely to slip on the high gear than on the low when pulling up hill. (2.) A pumpful every ten miles for medium speeds would be about right; half a pumpful every five miles is better. Evidently there is a leakage somewhere

in your crank case. (3.) The magneto should be timed as follows: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break and the ignition lever two-thirds advanced.

## A Sidecar to Prevent Skidding.

I should feel grateful if you would kindly give your opinion on (1.) The use of a light sidecar with normal power air-cooled motor bicycle to prevent skidding, having a  $3\frac{1}{2}$  h.p. three-speed, which I am often obliged to use in wet weather on very rough hilly roads, which are characteristic of this district (Wicklow), with plenty of mud. The machine is constantly skidding, and I have to use low gear practically all the while. Will it strain the machine if I fit a light sidecar on such hills, or would it merely remedy the complaint? (2.) I notice the engine will occasionally stop if I give its usual proportion of air, and about every ten explosions misses once or twice. The plug is clean and right. How can I remedy this?—W.F.M.

(1.) You can quite well use a light sidecar with this machine, and this would help to prevent skidding. Such a sidecar would not strain the machine in the least, and would enable you to get over the difficulty. The only objection to a light sidecar is that it might possibly upset when turning a corner, therefore

you would get steadier running by fitting a body in which there was a weight if you do not wish to carry a passenger. (2.) Perhaps there is a slight obstruction in the jet.

## Cleaning Macintosh Overalls.

(1.) Will you kindly tell me if there is a satisfactory way of cleaning double texture macintosh overalls, chiefly oil-stained?

I may say that I have tried soap and petrol without success. (2.) The oil seems to blow out of the crank case through the engine-shaft bearing on to the N.S.U. pulley, and of course is thrown in all directions. Is there any method of stopping this without re-bushing?—W.G.B.

(1.) We are afraid that there is nothing which will clean these garments satisfactorily. If you use an excessive amount of petrol you may remove the stains, but you will probably destroy the proofing. (2.) Possibly the pulley bearing is worn; if this be the case it will have to be rebushed. If the oil comes out of the gear itself there is nothing you can do, as the gear is lubricated by means of oil leaking from the crank case. If this be so, all you can do is to fit a shield to keep the oil off your clothes; or you may plug the hollow engine-shaft and fit another crank case release, in which case the gear should be lubricated occasionally by hand.

THE MOTOR CYCLE TO THE RESCUE  
ON FLAG DAY.

The driver of a sidecar brings another helper and a further stock of flags to the stall outside the Middlesex hospital.

**Pre-ignition.**

When travelling along (up hill, down hill, or level) the machine will lose power suddenly and smoke will come from the exhaust. The engine will generally continue to pull badly until I either lift the exhaust valve or close and open the throttle, when all will be well again and the smoking instantly disappears. Sometimes the engine loses more power than at others. I have had the machine at the makers', and they fitted a new cylinder and valves, which did not make any difference. I have also tried another carburetter and magneto without result. The valve gear and engine appear in perfect order, and I am totally at a loss to account for the trouble, which is very annoying when going up hill, as I have sometimes to run with the machine.—S.W.

The trouble is pre-ignition, caused by the use of an unsuitable plug, which results in loss of power and eventually stoppage. If the engine is pulled up even for a few seconds it will start again as well as ever and continue to run for a short time.

**Firing with a Closed Throttle.**

I have a 1916 two-stroke machine, which has rather an irritating fault. When I am running down hill, with the throttle fully closed, firing takes place intermittently, giving the machine a jerk each time. I would not mind an occasional explosion, but I suppose sixty to seventy occur a minute. I have made quite sure that the throttle piston reaches to the bottom of its seating when the handle-bar lever is fully closed, and I have also shut off the air valve as well when descending a hill, but the explosions still occur. I suppose this can be due to no other cause than gas getting past the throttle somehow. This, however, seems a good fit, and the machine is quite new. There are two other machines of the same make in this town (St. Anstell), and these have the same fault. The makers, to whom I wrote, replied to the effect that "it is quite impossible to prevent a certain amount of gas getting past the throttle when the lever is closed, and a charge being fired occasionally in consequence." (I presume they do not mean by "occasionally" one explosion a second!) Anyhow, this fault quite spoils the pleasure of going down hill, and I should be glad to know if you or any of your readers can suggest a way of overcoming this trouble. In other respects the machine is excellent. Perhaps some of your readers of an inventive turn of mind have succeeded in dealing with this difficulty. I do not wish to raise the exhaust lever, as I do all my driving on the throttle.—S.B.P.

The trouble is apparently due to a leaky throttle slide. One way to prevent the explosions taking place is to fit a magneto switch, which presents no difficulty, if you order a contact breaker cover

from the magneto makers to which a switch terminal is already fitted. It will be easy then to switch off when running down hill. Another way such explosions may sometimes be prevented is to open the air intake wide, and so weaken the mixture to such an extent that it will not fire.

A MOTOR CYCLIST IN A SANITARY SECTION.

Cpl. W. Carlyle Ford, a Douglas-mounted motor cyclist attached to a R.A.M.C. Sanitary Section in Egypt. Before the war, Ford was assistant surveyor to the St. Thomas R.D.C., Devon.

**Engine Refuses to take Air.**

I should be greatly obliged if you would advise me as to the probable cause of a little trouble with my machine. It is a 1914 4 h.p. Triumph fitted with semi-automatic carburetter. Up to the present I have been able, on the open road, to run splendidly with the extra air lever fully open and the gas about one-third open. After my last trip (i.e., the next day) without touching the machine in any way I found I could hardly open the air lever at all; the machine stopped almost at once if I did, even after running for some time. The machine still runs well, but gets much hotter. I have taken the carburetter and cylinder down, but find nothing wrong so far as I know (I am not an expert, but have a fair idea of the working of the machine). I have used Mex motor spirit for the last few runs, but that has not affected it before.—F.Y.G.

We can only think that the jet is partially stopped up, or that the petrol supply is impeded in some way. Perhaps there is

a piece of foreign matter in the petrol pipe. You should also make sure that no air leaks exist between the carburetter and cylinder, and that the valves are seating properly.

**EXPERIENCES WANTED.**

Readers desirous of obtaining the experience of others with various motor cycles or accessories must enclose a stamped addressed envelope in which the replies may be forwarded. Answers to the queries should be addressed c/o The Editor.

"Rex" (Chester).—1912 6 h.p. four-cylinder two-speed F.N. Reliability, maximum speed, consumption, tyre wear, and if suitable for occasional use with sidecar.

**RECOMMENDED ROUTES.**

OSWESTRY TO SWANSEA.—W.N.F.

Oswestry, Welshpool, Newtown, Llanidloes, Rhayader, Builth, Llanwrtyd Wells, Llandovery, Llandilo, Pontardunlais, Swansea.

LEICESTER TO WESTON-SUPER-MARE.—E.H.

Leicester, Sharnford, Coventry, Warwick, Stratford-on-Avon, Evesham, Tewkesbury, Gloucester, Filton, Clifton Downs, Flax Bourton, Congresbury, Weston-super-Mare. Approximately 140 miles.

ROTHERHAM TO BLACKPOOL.—J.W.J.

Doncaster, Ferrybridge, Aberford, two miles south of Wetherby turn left and go through Harewood, Otley, Ilkley, Skipton, Gisburn, Clitheroe, Whalley, Preston, Lytham, Blackpool.

WATFORD TO CHAGFORD.—P.T.W.

Watford, Rickmansworth, Uxbridge, Staines, Bagshot, Camberley, Hartley Row, Basingstoke, Andover, Amesbury, Hindon, Wincanton, Sparkford, Ilchester, Ilminster, Chard, Honiton, Exeter, Moretonhampstead, Chagford. Approximately 180 miles.

LEIGHTON BUZZARD TO HASTINGS.—A.S.

Leighton Buzzard, Hockliffe, Redbourn, St. Albans, Hatfield, Hertford, Harlow, Ongar, Brentwood, Ingrave, Orsett, Tilbury, by ferry to Gravesend, Meopham, Wrotham, Tonbridge, Pembury, Lamberhurst, Robertsbridge, Battle, Hastings.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

ADVERTISEMENTS in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munition of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## MOTOR CYCLES FOR SALE.

A.J.S., 6 h.p., 1914, lamps, indicator, spare tyre, accessories; insurance policy; bargain, £250.—Reevea Garage, Purley. 'Phone: 384. [X4136]

A.J.S. 1912 6 h.p. Twin Combination, coachbuilt car, a good outfit; £40.—Tuke and Bell, Motor Dept., Carlton Engineering Works, High Tottenham, N. [X4136]

A.J.S., 1913, 6 h.p., 3-speed, with Swan de Luxe car, new hood and screen (cost £4 Mar), latest and B. carburettor, 70 m.p.g. with passenger, speedometer, a grand climber, little used, and in perfect running order; 60 gns.—Frisby, 233, Westbo Grove London, W. [X4136]

A.J.S., 6 h.p., 3-speed, etc., late 1914, detachable wheel, spring pillar saddle, F.R.S. lamp, and cylinder, wind screen, hood, and storm apron, large of spares, recently thoroughly overhauled by master-bush, all faulty parts renewed, in perfect condition; price £90.—22, Westland Rd., Watford, Hert. [X4136]

### Alldays.

1914 4 h.p. 3-speed Clutch Alldays Matchless, 1st; £35.—24, The Parade, Upper Tooting S.W. [X4136]

COLMORE Depot, 31, Colmore Row, Birmingham can supply immediately all models of Alldays. [X4136]

1915 Allon, equal to new, Cowey speedometer, 1st horn, accessories.—Burstow, Westlands, Horsham, Sussex. [X4136]

ALLON, 1916, new, £36; owner in army, so easy use; offers wanted.—Gunner Harwood, Clifton, Fort, Isle of Wight. [X4136]

ALLON, 2½ h.p., 2-stroke, 2-speed model, splendid condition; £30; guaranteed.—Vauchope's, Shoe Lane, London. [X4136]

1916 Alldays Allons, 2-speed models, in stock; easy payments arranged.—Jones, Garage, Buryway, Muswell Hill. [X4136]

ALLDAYS Allon, 2-speed, new; special bargain £38/17 cash; gradual payments 2%.—Referee Co., 332, High Holborn. [X4136]

1915 Alldays 2½ h.p. Allon, 2-stroke, splendid condition, lamps, horn, tools complete; first secure.—Thompson, Asylum, Arley, Beds. [X4136]

1915 Alldays Allon, 2½ h.p., 2-speed, hand ch cost £45 last February; condition as new, guaranteed; sacrifice for £32.—Jones, 38, East Ave., Maidon. [X4136]

ALLONS, single speed £36, 2-speed £42, 2-speed £45; actually in stock; generous deferred terms.—Lamb's, 151, High St., Walthamstow, and 50, Rd., Wood Green. [X4136]

1914 3½ h.p. Alldays Matchless, Sturmer-Arch speed, Bosch, Sensapry, Dunlops, overhauled makers, first-class condition, spares, accessories; £25.—Jenkins, Grammar School, Coleshill, Birmingham. [X4136]

### Ariel.

ARIEL, all models in stock; easy payments arranged.—Jones, Garage, Broadway, Muswell Hill. [X4136]

3½ h.p. Ariel, perfect order; £7/10; exchange Walker, 39, Manor Rd., Bentley, Doncast. [X4136]

ARIEL, 2½ h.p., mag., Amac, with sidecar, in good condition; £12.—13, Batley Rd., Stoke Newington. [X4136]

## MOTOR CYCLES FOR SALE.

## Ariel.

**COLMORE** Depot, 31, Colmore Row, Birmingham. Have in stock for immediate delivery all models Ariel motor cycles, with or without sidecars. [0797]

**916 Ariel** 5-6 h.p. Combination, done under 2,000, guaranteed in first-class condition, all accessories; 2, easy payments arranged. Jones, Garage, Broadway, Newell Hill. [8566]

## Auto-Wheels

**UTO-WHEEL** and Bike, spring forks, as new; £20. -138, Church Rd., Battersea. [8474]

**UTO-WHEEL**, perfect, nearly new; bargain, £8/10. -Bausor, 1a, Mortlake Terrace, Kew. [8313]

**UTO WHEEL**, splendid condition, little used; bargain, £6/10.—Crow Bros., High St., Guildford. [8164]

**UTO-WHEEL**, as new, £10/10; also lady's Singer cycle, £2/10; together £12.—260, Well Hall Rd., Ham, Kent. [8359]

**VALL** Auto Wheel, 1914, complete, little used, equals new; £8/10.—Murray, 37a, Charles St., Hatton Road, Holborn. [X4252]

**VALL** Auto-Wheel, attached Rover cycle, 2-speed gear, with fittings complete; £8.—Seen Mostyn Range, Ackerman Rd., Brixton, S.W. [8293]

**UTO-WHEEL** in thoroughly good condition, with a new spare tyre, owner bought car; price £7/10.—est, 15, Gledow Terrace, Old Brompton Rd. [X3977]

**UTO-WHEEL**, 1915, attached 3-speed Ariel, excellent running order; £15/15; seen evenings by appointment.—Curtis, 13, Coniston Rd., Muswell Hill. [8353]

**DOUGLAS**, 1913, 2-speed, clutch, kick starter, very little used, perfect order; £37/10.—Railway Garage, Staines. [854]

**1915** 3½ h.p. Douglas, kick starter, new tyres, lamp etc., grand order; offers.—Healy, 7, Woburn Place, W.C. [855]

**1913** Douglas, 2½ h.p., clutch, horn, speedometer, good tyres; £32, no offers.—Stutfield, Grove House, Hampton, Middlesex. [833]

**1914** Douglas, 2½ h.p., clutch, kick starter, 2 speed Hutchinsons, perfect condition; £38.—Wallace Fountain Buildings, Bath. [824]

**DOUGLAS**, new, latest pattern, 2½ h.p., models for immediate delivery, including War Office flag Douglas.—Moffat, Yeovil, Tel. 50. [58]

**1915** Douglas, 2½ h.p., T.T., 2-speed, Lucas lamp speed indicator, perfect condition; £42/10.—Turner, High St., Walton-on-Thames. [822]

**1914** T.T. Douglas, 2-speed, Bosch, Amac, excellent condition, tools, sacrifice, first cheque £32 secured.—Harold Taylor, 19, Saxon St., Wrexham. [X424]

**DOUGLAS** Specialists.—Gibb, Gough, London Rd Gloucester. Gibb, the International Douglas rider winner of numerous cups and gold medals. [114]

**DOUGLAS**, late 1915, 2½ h.p., 2-speed, T.T., excellent condition throughout, Lucas lamp, spares; £4, no offers.—Neat, Ironmonger, Middlesbrough. [X41]

**1913** 2½ h.p. Douglas, 2-speed, lamps, horn, Cowe engine just overhauled, takes 2 anywhere, very fast; £30.—Sharpe, Fairfield, Kingston, Surrey. [827]

**1913½** Douglas, 2-speed, clutch, kick start, wide mud guards, extra good condition, recently overhauled, bargain, £34/10.—Jarvis, 8, Swiss Terrace, Hampstead. [X39]

**DOUGLAS**, 1914½, model T.T., 2½ h.p., 2-speed, parts in splendid condition; £38.—Rev. S. J. Fowler, Roche, Cornwall. (Mark envelope "Douglas".) [X41]

**WAR** Office Douglas, 2-speed, Bosch mag., little new perfect order, 2 lamps, horn, speedometer; £60 this season, £48.—Bunnett, 44, Rock Rd., Chislebury. [X40]

**DOUGLAS**, 1915, 2½ h.p., War Office model, excellent condition, overhauled, lamp, horn, speedometer; £45, or near offer.—Layton's Garage, Bicester Oxon. [X42]

**DOUGLAS**, 2½ h.p., 3-speed model, delivered months ago, scarcely been used, with horn, tools, lamp etc.; £52/10; guaranteed.—Wauchope's, 9, Shoe Lane, London. [84]

**COLMORE** Depot, Birmingham, Manchester, Leicester and Liverpool, have in stock complete range of models Douglas for immediate delivery, also full range of spares. [06]

**DOUGLAS**, 1915, Colonial model W, 3-speed, clutch, kick starter, lamps, horn, accessories, excellent condition, little used; 42 gns.—27, Seymour Rd., H. ringa, N. [85]

**DOUGLAS**, 1915, 2½ h.p., tip-top condition, low engine, done about 600, tested all the winter, Luv lighting, Klaxon horn; £45, or very near offer.—Ca Anne, Yorkshire Club, York. [X41]

**DOUGLAS**, 1915, 2½ h.p., 2-speed, footboard speedometer, lamp set, horn, purchased new 1 year, condition perfect; bargain, £46.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [06]

## The Inexpensive Passenger Motor Cycle.

**F**ROM almost the first days of motor cycles, designers have been scheming how best to make the machine carry a second passenger. First came the trailer, with its many obvious disadvantages; but this was short-lived. Then the tandem-seated tricar was over-elaborated until it became practically a three-wheeled car, and as such was found wanting in almost every case. The sidecar, in spite of its theoretical and mechanical faults, has survived the belt-driven cycle car introduced with such a flourish of trumpets, and appears to fill the bill better than anything else at present available.

Though at first devised simply as an attachment, the sidecar has become so popular that many machines are built which are intended to have their sidecars permanently attached. This being the case, it is somewhat remarkable that these combinations are still nearly always built as two units—motor cycle and sidecar—instead as in one homogeneous whole, designed throughout to stand the strains and stresses to which the loaded vehicle is likely to be subjected on the road. It is true that brazed lugs have given place to the detachable clips which once had to be fixed with much labour to the machine, and this is a step in the right direction, but it is about as far as makers have gone in most cases, even when the sidecar combinations are supplied only as complete vehicles and not sold separately. We are not alluding here to those motor cycles which have to serve the double purpose of solo mount and sidecar machine. These come into a different category, and must be designed with these objects in view.

So long as the driver of the motor cycle remains separated from his companion and exposed to the elements the sidecar combination cannot compete with the light car for the favour of those who place their comfort in a prominent position. The occupant of the sidecar is certainly

very comfortably situated, but not so the driver, unprotected as he is from rain and dust. This is certainly a handicap, though in the matter of speed, first cost, and cheapness of running there is no doubt but that the sidecar has the advantage.

From time to time double-seated sidecars have made their appearance, and this journal has done its utmost to encourage their development. Hitherto, however, "double sidecars" have been adaptations of the orthodox sidecar outfit, *i.e.*, the power plant has been mounted into a diamond-frame bicycle, and a very wide sidecar body fitted, with the controls suitably arranged for the driver's hand.

It has been left to the fertile brain of Mr. Alfred A. Scott to design a double-seated sidecar machine or sociable intended as such from the first stroke of the pencil on the drawing board. This machine, which bristles with ingenuity and originality throughout, we are privileged to introduce to our readers this week. We venture to think that its exclusive features will be studied with the greatest interest. Apart from the "flat" frame, which seems to mark a new era in sidecar construction, the Scott sociable possesses real novelty and attractiveness in design at every turn. It strikes us as the most promising "cycle car" design yet devised, and may revive interest in the vehicle which has hitherto proved an illusion, not to say a disappointment, to hundreds.

Whether greater advantages are to be found in a vehicle with three wheels or four remains at present a debatable point. The three-wheeler is cheaper to build and cheaper to run owing to its light weight. The four-wheeler has greater stability and a better appearance, and will no doubt be the ultimate choice of most men who can afford the extra cost. It must be mentioned, however, that Mr. Scott only adopted the three-wheeler after long consideration and study of the advantages and disadvantages of the two types.

# THE MOTOR CYCLE IN MESOPOTAMIA.\*

## Carrying Despatches Through Deep Mud and Blinding Dust.

The following extracts from a long and interesting letter, dated June 1st, from impressions of the hardships, difficulties, and dangers endured by our gallant men known as a T.T. and trials rider that he needs no introduction to our readers. Egypt, as well as Mesopotamia. The deletions are by the British Press Censor.

Corporal A. J. Sproston convey some in Mesopotamia. Sproston is so well He has seen service in France and

**T**O-DAY by the decree of a merciful Providence *The Motor Cycle* of April 13th, 1916, has fallen to my eager hands. It is your Spring Number. (By the way, congratulations on excellent production during war time.) Pleasant memories are revived by your contributor's reminiscences of bygone reliability trials, old faces, old places, old successes, and failures—all concerned in chasing the elusive "gold." These recollections sustain us in a country like this, where conditions create misery and horror. Active service motor cycling, with its varied aspects and vicissitudes, has been my bit in the great upheaval, but, experienced and optimistic as I am, I was never so convinced of the inherent excellence of the present motor cycle as I am to-day. I ask friend "Ixion" to believe that, since those anxious days of Mons, I have seen few breakdowns directly traceable to faulty design or construction. The large number of mechanical casualties could almost wholly have been avoided by intelligent anticipation of, and provision for, abnormal strains and stresses by the rider. I wager that most of our despatch rider artificers will support me when I say that 75% of their labour is the outcome of neglect. On the other hand, I urge manufacturers to give us increased diameter in wheels, which will also bring about increased ground clearance; handle-bar operated clutches are absolutely essential (this point does not require discussion); a totally enclosed kick-starter; and folding crank.

### Active Service in the East.

To turn to the more personal side, I will endeavour to interest you in an extract or two from my notes, from which you may gather that we have our share of Active Service trials and tribulations. After a few pleasant months' sojourn in Egypt in charge of D.R.'s, I tired of the, more or less, strict routine duties that obtain at a big base, and, sniffing excitement, I prevailed upon my C.O. to release me to a division soon to go into action. Successful after a lot of juggling with rank, I soon saw the finish of a 150 mile train crawl, and joined the 13th Division under orders for Mesopotamia at headquarters on the sands at —. During the short stay here for refitting purposes I am on duty; weather, dull and wet. The seas of slimy mud vividly recall the earlier days of the campaign in France. The machine slithers and writhes beneath me as I pick my way around and out of the holes in the "road." Natives driving bony horses and rickety carts bear down upon one with yells and cursos. After the privations of a three weeks' journey by sea and land we arrive at —, pending a move in the direction of Kut-el-Amara to attempt the relief of General Townshend,

beleaguered there with his gallant force. To our dismay, it is thought that we (motor cyclists) will be unable to operate with our machines higher up the Tigris, so we are supplied with horses after landing in the motor cycles to store.

I will not dwell upon the limitations, bordering upon futility, of this new form of despatch carrying, but after a week or so of preparation (for the time a closed chapter) we move forward to engage the enemy. I give my notes:

### The Attempt to reach Kut.

The last day of March, an uncertain drizzle, not unlike the Scotch mist, and shutting out from view the grey, snow-capped mountains. All is now ready for the big offensive, and we spend the day idling around. At 7 p.m. we move off to march up to —. Following by the bank of the river we have not gone far when a long-promised storm breaks, sheets of water hurtle down, and then

Cpl. A. J. Sproston, whose interesting account of his doings as a despatch rider in Mesopotamia appears on this page.

for hours lightning plays around. By its flashes our horses pick their way through the heavy going. We climb in and out of Turkish trenches and gulleys, these now turned into miniature rivers and quagmires. Soaked to our skins and shivering with intense cold, we drag along through the night. Down on its knees and now upon its haunches my horse sinks, sliding and plunging through the horrors of the inky darkness. Eagerly awaited dawn breaks, exposing sheets of water over this vast terrain, fallen mules that cannot rise owing to loaded packs, and huddled groups of men in baths of liquid mud. So we cover the ten miles to —, fourteen hours of misery. No food till evening, bully and biscuits mixed with dirty water from the Tigris. Late that evening another storm, most of the fellows out in it all. I am luckier, and get invited to a tent by some kindly Indians. These coloured warriors soon get tea by aid of a Primus stove. Thus refreshed, I tumble down side by side with a hefty Sikh, and fall into the deepest sleep enjoyed lately.

Censorship restrictions prevent me from

detailing my experiences during the series of furious battles for Kut, in which, I trust, we D.R.'s played no light part. We all deplore that a result commensurate with our efforts was not secured.

### A Dust Storm.

However, I jump to May 1st, the early part of which was devoted to a visit from our Commander-in-Chief. Finished before breakfast, and then hell-devised misery breaks upon us in the shape of a south-westerly gale, creating a dust storm that blinds and stifles, bearing along blasts of scorching air. Neither nook nor cranny can be found to afford protection, and we motor cyclists drag our horses to the river, fighting a passage through sand clouds. Once again in possession of my motor cycle, I force my way over trenches up to Brigade H.Q., kicking the ground to assist the maltreated machine, and through dust, at the same time snatching a hand from the hot bars to fight the flies that assail my nose, eyes, and ears.

MAY 2ND.—Heat still terrific. We are adopting all sorts of weird adaptations in dress in order to keep cool—football type knickers, shirts worn outside to keep up a circulation of air around the body, sleeves laced off tunic or shirt at the elbow, a battered helmet smacked down over the ears giving protection to forehead and neck, all covered by a linen net to ward off flies and mosquitoes. Thanks be to Heaven that we can wander indolently down to the Tigris's picturesque banks to bathe and wash our scorched and blackened bodies.

### The Douglas Suspected.

Leisure in plenty just now, and relieved of most of the despatch work at night. The depredations of the Arabs after dark bring about an offer of — rupees to any sentry or picquet shooting or capturing one of the thieves. At midnight I am down on the warm grass in the close confines of a blanket, and my slumber is broken by the voice of a guardian of the night in whispering consultation with a *confrère* anent a suspicious-looking figure crouching down upon the other side of the trench, shades of — rupees looming large in their imaginations. They discuss the advisability of bayoneting or firing upon the intruder. Raising myself, I peer in the direction of the suspect; it is my inoffensive all-black Douglas, reclining peacefully where I dropped it. At the top of my voice, and with an adjective or two added, I acquaint the anxious ones with the nature of the suspect. They retire, wounded in pride and pocket.

A few days elapse, each one hotter than its predecessor. I am ordered by the staff to proceed on my machine to — and search the vicinity for certain units. A good breakfast, well armed, a full

\*Passed by the Censor.

**The Motor Cycle in Mesopotamia.—**

water bottle, and a trusty Douglas in good fettle for a trying ordeal. The first few miles are covered without incident. Falling in with a brigade office, I am urged to go on by another route, because within hailing distance an hour or two back one of their waggons was looted, three men and horses also taken; but getting along I see no more cause for alarm than a single Arab climbing cautiously out of a hole. Crashing and smashing along, my poor little machine is just flung about by the execrable mud heaps of the plains, plunging into trenches, and ploughing through paths of suffocating dust. Constant recourse to my water bottle, the liquid now almost to boiling point from the sun's rays, is the only method to avoid collapse. Heated chunks of air waft along, as hot as the gases exuded from the plucky little motor. When remounting after a stop, even contact with the burning saddle becomes torture to the body. This is motor cycling at 110° in the shade!

To digress somewhat, I would set out that this wonderful behaviour of the motor cycles, and the treatment I have endeavoured to describe, is part of the daily routine. Certainly the journeys undertaken are short, but the accumulated mileage covered without mishap or repair is stupendous. In addition to drawbacks, we have no tools or organisation to cope with breakages, and an all-round shortage of oil and petrol. Up to within a few days back, two machines have been carrying out the work normally undertaken by ten horses, so when a few more machines came to hand great was the joy in the hearts of the motor cyclists at the departure of the animals. I will not dilate further upon the prowess of our mechanical steeds, but to my muttons. My water supply soon gives out, and it is not long before I am in the throes of a terrible thirst (here I am afraid of the Censor). Anxiety and pain allayed as I spot in the hazy distance what proves to be part of the — Field Company. Pushing ahead, after consuming enough water

to float a Dreadnought, I run into a maze of trenches fronting the now notorious position of — (etc.). Beyond this young Achi Baba, the plain, devoid of vegetation, provides easier going, and soon I can distinguish the welcome tents of those I am out to find. A short stay and some tea. I then make a bid for my fifteen-mile journey back to camp. Home just inside two hours, tired and hungry—the finish to one of the most arduous and difficult rides I have ever accomplished.

**AN OBSERVER KILLED.**

SEC.-LT. J. C. M. STEWART, Royal Flying Corps, early in July was killed while acting as an observer in an aeroplane returning from a successful bombing expedition over the German lines. Mr. Stewart was a director of Noel Paton, Ltd., and at the outbreak of the war he was forming a company for the development of his invention of a four-speed chain gear box for motor cycles.

**MAIMED RIDERS.****ALTERATIONS TO STANDARD CONTROLS.**

AFTER the war there will be numerous men, alas! minus legs and arms who will wish, if possible, to follow their old pastime of motor cycling or car driving, as the case may be. As a matter of fact, there are already a few instances of men discharged from the Army through the loss of a limb who, by the help of manufacturers, have been able to return to their old hobby. This applies in particular to car owners, but if the controls of a car can be adapted to the needs of a man deprived of a leg or an arm, surely those of a motor cycle can. The average motor cyclist is such a keen man that the loss of a limb in the service of his country is not going to prevent him from returning to his favourite pastime as soon as

a Kettering reader, Sydney Davis. He, with a friend who shares the same misfortune of having lost an arm, does a good deal of riding. Davis rides a two-stroke Sparkbrook and his friend, H. Winstone, a Douglas. Winstone has lost his left arm, and the only alteration to his machine has been the placing of the exhaust lever on the right side of the handle-bar instead of the left.

As Davis has lost his right arm, it meant the controls of the Sparkbrook being brought to the left, leaving the right handle end bare. The latter was straightened out, as shown in the sketch, and a piece of steel screwed on to provide a rest for that part of the right arm, i.e., to the elbow, which Davis still has. This leaves his one hand free for the controls.

Handle-bars of Sparkbrook, adapted for a rider who has lost his right arm below the elbow.

he can, and it is to be hoped that the manufacturer will help him by making the necessary alterations in the control arrangements.

**Many One-armed Riders.**

That the loss of an arm need not deprive a man from enjoying the delights of motor cycling has been proved more than once in the columns of *The Motor Cycle*. Another example is supplied by

**TWO ONE-ARMED MOTOR CYCLISTS WHO THOROUGHLY ENJOY RIDING.**

Recent references in our pages to motor cycling for men who have lost a limb have brought forth the above photograph from Sydney Davis, of Kettering (on the left). Both he and H. Winstone, on the right, have been riding for about two years. The machines are a 2½ h.p. Sparkbrook and a 2½ h.p. Douglas.

## OCCASIONAL COMMENTS.

By "IXION."

**False and True Ideals.**

To-day's post brought me the most original and amusing letter I have ever received from a reader. It happened to be intensely abusive, and anonymous, except in so far as the writer confessed to being a corpulent *paterfamilias* of over forty; and its main interest lay in the fact that it was a radical and bitter denunciation of the whole policy of the trade, and also of the technical press. To put its point in a nutshell, the critic complains that motor cycling is being run in the interests of people who cannot ride—duffers, elderly men, weaklings, and (he reserves his most scathing language for these) women! In other words, those who have influence in the development of the sport and industry are pushing variable gears, which render hills climbable by indifferent riders and indifferent engines; are pushing spring frames, which will attract soft-skinned hedonists into our ranks; and are generally trying to convert motor cycling into a cotton-wool sort of pursuit. The thorough-going nature of my correspondent's denunciation is evident from one sentence, "I have ridden every type of variably-g geared motor cycle built since 1903, and I despise them all!" He ends up by surmising that I am getting old, soft, and lazy, and that my two ideals are to make motor cycling as cosy and lazy as I can, in the dual interest of gilding my own labours and of getting as many readers as possible for "my paper" (wish it were mine, by the way!).

**The Dilemma.**

Unwittingly my correspondent is criticising not the policy of *The Motor Cycle* or of our leading factories, but the whole trend of modern civilisation. Life was far more strenuous in the Middle Ages, and developed a few cast iron individuals at the expense of the weaker ruck who went to the wall. 1903 marks the mediæval period of motor cycling. Only a cast iron athlete could regularly employ the motor cycles of that day for prolonged hard work; we had very few riders, but those who stood the racket could ride. To-day we have thousands of riders, most of them somewhat weakly and unskilled; when their engines get into rotten order, they climb hills by changing gear; when the engines get still worse, they pay a mechanic to tune them up; and so good riders are comparatively scarce. We are developing, as a world, on the lines of the greatest happiness for the greatest number; and if my friend despises that philosophy, he must tilt at bigger men than I am, and at vaster institutions than *The Motor Cycle*, or the industry which it attempts to serve. Until he has succeeded in revising the principles which at present influence civilisation, he will fail to reconvert commercial industries, like the motor cycling trade, into restricting their energies to producing half-rideable machines for the delight of a few eccentric stalwarts.

**Some Might-have-beens.**

On the positive side his letter was more interesting. He asks why *The Motor Cycle* and the trade have not shelved variable gears and spring frames in favour of engines that will keep really cool all the time; engine bearings that will remain perfect for three years; absolutely silent valve gears; plugs that won't pre-ignite,

yet will start as easily as the standard Lodge; 32in. wheels and 3½in. tyres; more comfortable saddles; overhead valves with detachable seatings; steel cylinders covered with copper; cooling fins right down the cylinders; outside flywheels with hollow rims full of mercury; Whittle belts made of rubber blocks; the abolition of the "harsh" chain-cum-belt; the utter condemnation of all baby two-strokes, on the ground of their high fuel consumption and general inefficiency (as compared with good four-strokes of equal capacity); the complete and final abolition of all V twins; and a variety of other fads less original in character. (One rejoices to see that, like all root-and-branch reformers, our iconoclast cannot be consistent; several of his ideals are devices for increasing his personal comfort and simplifying his labours, despite his professed yearnings for the strenuous life.)

**A Special Demand.**

On the whole, this letter, like so many others which I have received, goes to prove that there still lingers an unconquerable but limited demand for the so-called T.T. model, to wit, the simple, single-g geared roadster, with a high-efficiency engine, which makes the highest possible demands on its owner's riding and tuning skill. This demand is recognised—or was up to 1914—by most manufacturing concerns. It is the exception to peruse a catalogue which does not list a T.T. model. Yet such inclusions do not quite meet the point. They usually take the form of the standard roadster model, minus its gear box, plus a special pair of handle-bars, plus possibly a special set of cams or lighter reciprocating parts. But what the sportsmen want is a high-efficiency single-g geared model, specially thought out from lamp bracket to back mudguard.

**In Reply.**

On the main question my friend is far too slashing. There are plenty of hard riders left; in fact, there are more than ever there were. Peace-time trials show it. Anybody who has seen Gibson or Bischoff coaxing a 3½ h.p. sidecar outfit through a Six Days course knows that mechanical skill has not been slain by variable gears; anybody who saw a certain team of riders with 6¾ gears attack the Applecross hairpins in the last Scottish Trials knows what recklessly daring cornerwork is; the T.T. races are not picnics, as Jake de Rosier perceived, and some of the D.R.'s daily lives contradict all my correspondent's deductions. For the rest, motor cycling may not be on the average as sporting a hobby as once it was, but the duffers and weaklings who ride nowadays would be even less strenuous and less sporting if they were not motor cyclists; they would be sculling or playing tennis or watching professionals play footer. As it is, they are facing the problems of the road, they are burdened with the task of bending a whimsical engine to their wills; they are within the zone of infection of the speed fever. If they are less dashing and daring than the pioneer motor cyclists, they are nevertheless more of men plus the motor cycle than they could ever have been minus the motor cycle. It is nonsense to pretend that motor cycling is sapping the manhood of the nation; it would be truer to say it has played its part in salving it.

## THE 8 h.p. FRERA.

A NEW ITALIAN MODEL BUILT ON DECIDEDLY BRITISH LINES.

## FRERA FEATURES.

8 h.p. 45° Twin, 1,140 c.c.  
Overhead Inlet Valves.  
Automatic Claudel-Hobson Carburetter,  
Splittorf Magneto.  
Best and Lloyd Pump and Drip Feed  
Lubricator.  
Three-speed Countershaft Gear Box.  
Multi-disc Clutch, handle-bar  
controlled.  
Entirely Enclosed Chain Transmission.  
Kick Starter.  
26 x 3in. Tyres.

The new 8 h.p. Frera, one of the latest Italian productions. It has overhead inlet valves, while the transmission is by entirely enclosed chains. The tendency for machines of foreign origin to follow British lines is most noticeable in this mount.

detachable, complete with the valve and seating. An automatic Claudel-Hobson carburetter is used. The machine, we can well believe, is very silent, the exhaust being led first through a large expansion box, from which it passes through a long extension pipe.

## Clutch and Transmission.

A countershaft three-speed gear box, provided with a handle-bar controlled multi-disc clutch, is fitted. The chain

transmission is neatly enclosed in oil-tight chain cases. The machine is built specially for sidecar work, and lugs for the sidecar attachment are incorporated in the frame.

As will be seen from the illustration, the whole machine has a most business-like appearance.

This firm also make a 4 h.p. single for sidecar work and a 2½ h.p. lightweight, both of which models are used by the Italian Army authorities.

## GIRLS' PLUCKY ENTERPRISE.

Two New York Ladies Attempt a Journey Across the American Continent.

## ACROSS THE AMERICAN CONTINENT.

Miss Adeline Van Buren and her sister, Miss Augusta Van Buren, with their Powerplus Indians, on which they are attempting the 3,814 mile journey from Sheepshead Bay to San Francisco.

ON July 4th two enthusiastic New York girls started on the arduous and enterprising task of riding two motor cycles from Sheepshead Bay to San Francisco (a distance of 3,814 miles), which city, according to their schedule, they should reach by August 9th. This is the first coast to coast ride ever attempted by women, and anyone who has read of the difficulties encountered by riders on previous attempts will appreciate the magnitude of the undertaking, and, should they be successful, it will undoubtedly reflect great credit on both the reliability of the machines and the pluck, endurance, and skill of the riders.

Both Miss Adeline Van Buren and her sister, Miss Augusta Van Buren, were born athletes, and from early childhood have indulged in many different sports, including skating, swimming, horse-riding, and so on, in all of which they have been very successful. Motor cycling, however, has eclipsed them all, and for the past three years has reigned supreme in their estimation.

They both ride 1916 Powerplus rear-sprung Indians, mounted on which they are seen in the photograph. Their dress, though perhaps somewhat unconventional, is undoubtedly neat and serviceable.

## Lakeland's First Outing for Wounded Soldiers.

### A SUCCESSFUL TRIP IN WET WEATHER.

By GEORGE D. ABRAHAM,

*Author of "Motor Ways in Lakeland," "The Complete Mountaineer," "Mountain Adventures at Home and Abroad," etc., etc.*

"**W**ORSE than 'Wipers' at its wettest!" Thus spake one of the many jovial and irrepressible Tommies who participated in the first "joy-ride" of its kind in Lakeland. Everything had been beautifully planned except the weather, and few found joy at the outset from Kendal in such a downpour as even Lakeland seldom sees.

However, the party came through mist and moisture cheerfully to find shelter and dryness amongst the leafy shades on the shores of Windermere. Clouds hid the mountains, but not the smiling faces of the kindly natives, who fairly showered roses and numerous other good things on the men who had "done their bit." The fifty-odd wounded soldiers, many of them North-country sportsmen who have been shorn of arm or leg, are not likely to forget their Lakeland outing.

#### Strange Behaviour.

A midday lunch had been planned at Keswick, in that popular haunt of motorists, the Royal Oak Hotel. The way thither lay through Ambleside, along the shores of Rydal Water and Grasmere, and over the cloudy heights of Dunmail Raise. The only exciting adventure of the outing occurred at Grasmere. On one of the awkward turns the sidecar driven by F. Chadwick was run into by a motor cyclist coming in the opposite direction. Serious damage was done to the sidecar, and the driver sustained a sprained ankle, but, sad to relate, the driver of the colliding motor cycle recovered himself and rode off without even an apology. Let us hope an explanation may be forthcoming. Chadwick's machine was left behind, and its two passengers gathered up by the car in charge of Mr. Miles, of Kendal, who was official collector of derelict passengers and drivers. Ere the day was done he had a large and jovial crowd aboard.

#### The Weather Improves.

Little was seen of the grandeur of the western road along Thirlmere and its craggy surroundings on the outward run, for damp clouds filled the narrow dale, but during the two hours' halt at Keswick the mountains shed their misty mantles for a while. The sun actually shone for a few seconds of silvery gleam on Derwentwater as the long hill of Castlerigg was climbed on the return journey. Then, later, there was a chance for a few moments of seeing something of Thirlmere during the sprint along the splendid road on the east side. At a suitable place for the camera man a halt

was called, and the fact noted that the beautiful sheet of water which now supplies Manchester with water has for the first time reached its full height of fifty feet above its original level. "No wonder!" said one jocular Tommy, who had still moist memories of the morning deluge.

#### Welcome Gifts.

Then, on the south-westerly top of Dunmail Raise, came another halt, of which the natives had evidently heard rumours. A party of ladies dispensed cigarettes and various delectable fruits. A characteristic picture

The wounded soldiers enjoying the beautiful scenery under Helvellyn. The water in the background is Thirlmere.

was that of a one-legged Scotsman, with a cigar between his teeth, a cigarette behind each ear, an orange in both hands, and through it all a smile that defies description. At Ambleside there was a flowery welcome, and white heather as well as splendid roses gave obvious pleasure to the recipients. After tea came the delightful evening ride along Windermere, with the Pikes of Langdale, now almost clear, mirrored in the lake's purple depths. Kendal was reached over Banerigg and through Staveley. Though the dull weather hid much of the glory of the district, the outing was voted an unqualified success. Much of this was due to the energy of the organiser, Mr. George Braithwaite, who had gathered in the soldiers mostly from the V.A.D. hospital at Kendal. He also, on his Morgan, acted as "whipper-in" during the run. The

**Lakeland's First Outing for Wounded Soldiers.—**

excellent plan was followed of each sidecar owner providing the day's entertainment for his passenger—a capital arrangement which prevented calling on public subscription in these times when generosity has so many calls.

Nearly every well-known make of machine was represented, and several noted riders of competition

days were conspicuous. Notable amongst these was B. Jefferies, alas! shorn of one leg, but able to handle a Perry light car most efficiently. Harry Whinnerah, the well-known one-armed driver of the A.J.S., had a passenger likewise handicapped, and his joke was that, whatever trouble arose *en route*, they should be able to surmount it, for they had at least two arms between them.

A halt for a photograph on Dunmail Raise—a beautiful pass through the Lakeland mountains.

## Kick-starter on Sturmey-Archer Lightweight Gear.

**W**E have already announced the fact that after the war a two-speed Sturmey-Archer countershaft gear will be obtainable for lightweight machines. Its features were outlined in *The Motor Cycle* of March 30th, when we referred to it as the result of a trial we had been privileged to make with the gear fitted to a Sun two-stroke lightweight.

Since that time the gear has been subjected to many miles of road testing, and a kick-starter has now been added, the design being much the same as in the three-speed S.A. gear, now so largely in evidence, and embodying the same anti-backfiring arrangement. Complete with the kick-starting mechanism, which, of course, entails the use of a separate pair of gear wheels, the gear now weighs 17 lb. The action of the kick-starting pedal is controlled by a spiral spring, having six coils, one end of which is secured in a disc, having holes around its periphery. The disc being permanently held in position, it will be gathered that

the spring can be tensioned up by moving the end to the next hole.

### Unusual Method of Operation.

Another striking change in connection with the gear is the method of control, which is all arranged on the gear box itself. There are two pedals, one above the other, the duty of the lower one being none other than to press the top lever upward. To engage the low gear the top pedal is depressed, and to effect the change the lower lever, which, of course, extends an inch or two beyond the low gear pedal, forces the top pedal upward and thus engages the high gear. It will be understood that by doing away with the more usual rods and hand control of the gear, objectionable rattles, due to wear of the joints of the controlling rods, are done away with, besides which adjustment is seldom necessary. Foot control on the gear box has the further advantage of enabling the gear box to be dropped out of the frame in a few moments.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### The Low Generator.

**[?]** I should be glad to know if the Low acetylene generator is adapted for use on a motor cycle, and if it can be used with any make of acetylene lamps, and for tail as well as head light.—C.S.W.R.

Yes, the Low generator is made in a size suitable for motor cycles, and would supply sufficient gas for both head and tail lamps. No special lamps are required.

### Difficult Starting.

**[?]** I have a 6 h.p. sidecar combination which I find very difficult to start when the cylinders are cold. I have to inject a large quantity of petrol before the engine will start. I have trouble with the throttle and air levers; also, the throttle refuses to open, at times making it so that I cannot close the air, but when I have snatched the throttle open I find that there is no resistance to the air being closed.—R.H.

We should advise you to take the carburettor down, clean it, and see that the throttle and air slides are working freely; also see that the air closes properly. Any air leaks at the carburettor air slide, at the induction pipe, or carburettor unions, will militate against easy starting.

### Cooling for Stationary Engine.

**[?]** I am using a 2½ h.p. four-stroke a.o.i.v. motor cycle engine as a stationary power plant, but I am troubled with cooling the engine. I have tried several fans, the present one being the most efficient, but not good enough yet. There are eight blades measuring 3in. x 1½in., and it is driven at about six times engine speed. Can you recommend any special method or any size of fan for cooling the engine? The fan is on the valve side of the cylinder.—P.V.B.

Your overheating trouble may not be due so much to an inefficient fan as to some adjustment of the engine being wrong, such as the a.o.i. valve having too great a lift, too weak a mixture, the carburettor supplying too rich a mixture through having too large a jet or insufficient air. Adjust the carburettor in such a way that when full air is given the engine will misfire or stop. This will ensure that the mixture is not too strong. See that the valve tappet clearance is not too great; also make sure the exhaust is quite free, and not causing back pressure. We should think that your fan has too many blades. It should be quite sufficiently large, especially when driven at six times engine speed.

### The Engine as a Brake.

**[?]** In the case of a 1916 two-stroke, (1) Should the engine be used as a brake downhill? Are there any drawbacks? (2.) Can four-stroking at speeds of less than twelve miles per hour (top gear) be cured? I fancy the cause is carburation in my case, but do not know what to do. There has been flooding, which aggravated the four-stroking, but the machine had a tendency to four-stroke from the start.—F.T.

(1.) There is every advantage in using the engine as a brake when descending a hill. There are no drawbacks. (2.) It is exceedingly difficult. Most of these engines refuse to run very slowly. Probably a smaller jet would cure the difficulty to some slight extent. The flooding should, of course, be cured.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

### Cracked Exhaust Seating.

**[?]** For the second time I have had a motor cycle cylinder crack across the exhaust valve seat at the thinnest part of the cylinder wall. I am very interested to know what are the general causes of this and the best preventive course to adopt. Would over-carbonisation at head of cylinder have a tendency to make the cylinder metals of too varying thickness, and thereby strain molecules of metal when the cylinder cools down, causing the same to crack at the weakest part?—E.J.L.

The usual cause of the valve seating cracking as you describe is a faultily designed cylinder, which is unable to stand up to any undue heat. There is no preventive except not overworking the engine. Carbon deposit will not cause this trouble. You might be able to get the crack satisfactorily welded, but the better way would be to get a new cylinder.

### Fitting Oil Feed to Front Cylinder.

**[?]** I am fitting a drip feed to my front cylinder. Would you please tell me how far up from the base of the cylinder to tap the thread? Engine 4.5 h.p. J.A.P.—F.S.H.

Any point in the cylinder wall is suitable, provided that it is below the level of the piston top when the piston is at its lowest point of its stroke. Probably 1in. to 2in. from the cylinder base would be about right.

### Position of Outside Flywheels.

**[?]** Will you please inform me (1) Why the outside flywheel of a two-stroke engine is always on the near or driving side? Has the off side been tried? (2.) Is there any reason why the inside flange of a large pulley (9in. or so) should not be weighted to balance the engine and an outside flywheel dispensed with?—H.K.P.

(1.) Flywheels have been fitted on both sides. At present the Baby Triumph has its flywheel on the right-hand side. (2.) No advantage would be gained by weighting the pulley, as the engine should be perfectly balanced otherwise. On most engines your idea of combining the pulley and flywheel would not be of any use, owing to the fact that they are chain-driven to the countershaft gear box.

### Petrol Lubrication.

**[?]** I am a rider of a 2½ h.p. two-stroke, and am puzzled as to how much oil to mix with the petrol. The instructions on my tank are one-sixteenth of a pint of (T.T.) oil to one quart of petrol. Those on my friends' tank one-eighth of a pint to one quart. I have also seen suggestions of one-sixth of a pint to a quart. Another maker's measure for a 2½ h.p. two-stroke appears to contain not more than one-twelfth or one-fourteenth of a pint to a quart. These figures differ so considerably that I should be extremely glad to have your, or any of your readers', experiences as to the best and safest speed running mixture for short and for long journeys.—PERPLEXED.

The usual proportions are one-fourteenth to one-sixteenth, i.e., roughly half a pint, to one gallon of petrol. Some machines will take more, and some less. If you occasionally see smoke from the exhaust pipe upon opening out after switching off for a short distance, the quantity of oil is about right, viz., slightly on the over-lubricating side.

# "THE MOTOR CYCLE" RECRUITING SECTION.

## Requirements of the Motor Machine Gun Service.

SINCE the announcement in our last issue went to press, Mr. Geoffrey Smith, editor of *The Motor Cycle*, has received fresh instructions from the Commanding Officer of the Motor Machine Gun Service as to future requirements; applications from recruits will continue to be dealt with, and men of suitable experience with cars or motor cycles accepted for this Service. It should be noted from the particulars of enlistment detailed below that youths who have attained eighteen years of age may now be accepted. This will no doubt give pleasure to many youthful readers who have had to be rejected in the past on account of their age, and all such may now apply again, or attend one or other of the inspections.

On Tuesday next, August 1st, Mr. Smith will attend at the Coventry Recruiting Office, Masonic Buildings, Little Park Street, between 2.30 and 4 p.m., in order to examine candidates for enlistment, and on Wednesday, August 2nd, at the Recruiting Office, Stanford Street, Nottingham, between 2.30 and 3.30 p.m.

It is proposed in the near future, provided that there are a sufficient number of applications from the north country, to arrange an inspection at Manchester, but the time and date will be announced in a later issue.

The amended conditions of enlistment in the M.M.G.S. are as follow:

**EXPERIENCE.**—At least one year's motor cycle or car driving experience.

**AGE.**—18 to 40.

**ENLISTMENT.**—For duration of the war.

**MEDICALLY FIT.**—For general service abroad or for garrison duty abroad.

**PAY.**—1s. 2½d. per day, all found; the usual separation or dependant's allowance.

### Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

It should be noted that the present vacancies are in the Light Section. Enquiries for enlistment into the Heavy Section Machine Gun Corps (which was closed a month or two ago) still continue to reach us, though it has been stated on several occasions that this section is closed.

We receive many letters both from home and abroad, from men desirous of transferring to the M.M.G.S., but it will save time and disappointment if we mention that transfers are not possible.

In applying for enlistment into the M.M.G.S., recruits should state:

- (1.) Age.
- (2.) Experience.
- (3.) If called up and date.
- (4.) Whether fit for service Overseas.

The following men were accepted for the M.M.G.S. last week:

Brady, L. W., London.  
Chapman, J. G., Cambridge.  
Clare, J. W., Wolstanton.  
Clunie, A. S., Manchester.  
Cook, G., Chalford Hill.  
Coulthard, R., Cleator (Cumb.)  
Ferguson, R., Galashiels.  
Franks, P., Workson.  
Grace, A. D., London.  
Hunthouse, H., Newton (Derbyshire).  
Jones, H. B., Wrexham.  
Jones, T. I., Wrexham.  
Littleproud, M. B., Swaffham.  
Masters, H. G., London.  
Milward, F. T., Clevedon (Som.)  
Selleck, F. C., Bradford.  
Sidwell, E. A., Darlington.  
Thornton, E., Yardley (Birm.)  
Tippett, F., Praddon.  
Webster, F. O., London.  
Williams, E. V. O., Ellesmere.

It should be noted that all recruits for the M.M.G.S. pass through Mr. Geoffrey Smith's hands. Frequently letters are sent on by recruiting officers and others for attention, but delay sometimes means that a man is due for service before the application reaches Mr. Smith.

### A Youngster's Desire Fulfilled.

A fortnight ago we referred to the case of a youngster of eighteen who, having failed to secure local enlistment into the Royal Flying Corps, communicated with the headquarters at Farnborough, Mr. Pemberton Billing, and finally with H.M. the King. No success attending his efforts, he wrote to us. The paragraph respecting him attracted the attention of the Officer-in-charge of Trade Tests, Duke of York's headquarters, Chelsea, S.W., who wrote to us for the man's address, which we furnished, and the recruit in question—C. C. P. Marriott, Barrow Hill, Chesterfield, was last Thursday accepted for training as a fitter and posted to the R.F.C. Depot at South Farnborough.

We are officially advised that the Royal Flying Corps is open again for experienced motor cyclists between the ages of 19 and 45. Applicants must have passed for general service.

### DESPATCH RIDERS R.E. SIGNAL SERVICE.

STILL another new regulation to be observed by prospective recruits in the R.E. Signal Service is that candidates for this section must have been educated at a public school, University, or have received professional education. We have already mentioned that the new age limits are 19 to 35. Several men in the South Midland divisional area were examined by the Editor last week.

### PETROL ALLOWANCES.

A cycle agent's week-end joke (?).

machine for running to business. Asked for two gallons per week.

All are allotted six gallons.

Apparently no discrimination whatsoever has been made, and if it proves to be general throughout the country a strong protest will be the result.

Quite apart from this entire lack of discrimination, it seems rather remarkable that claims of those using their machines solely for pleasure should be dealt with before business claims.

On the petrol census forms users filled in their requirements on a monthly basis. The wording on the petrol permit form is "Total number of gallons based on a three months' supply." Thus two interpretations can be placed on the latter, i.e., that the amount given is for one month or for three months, though it is almost certainly for the longer period.

After receiving petrol permit forms, users remit to the Petrol Control Committee the licence duty, at 6d. per gallon, due on the amount of petrol allowed. Upon receipt of this duty the Committee send users a licence for the amount named.

## ORDNANCE WORKERS' HILL-CLIMB.

Sixty-five Competitors in a Hill-climb at Newnham confined to C.O.W. Badged Men.

At the starting point of the Coventry Ordnance Works hill-climb at Newnham, near Daventry, on Saturday last.

SOME slight indication of the spread of the motor cycle movement is seen in a hill-climbing contest held at Newnham, near Daventry, on Saturday last. This event, though confined to employees of the Coventry Ordnance Works, attracted sixty-five entries, though this number by no means represents the number of devotees of the motor cycle at this one works.

To Mr. J. W. Hodgson, the assistant manager of the Howitzer Department, the competition owed its initiation. A committee was formed at the works, the A.C.U. was approached, the Newnham District Council's permission obtained, and, despite difficulties faced in the way of timekeepers, petrol shortage, and hill-climbing equipment, a very successful affair was the result.

The C.O.W. workers are nothing if not 'practical, and consequently the machines came to the starting line in fine trim, and if only the riders had learned the value of a quick start, and the inadvisability of changing up too soon, the times would have been better than they were. As it was, seconds were lost in getting away, and only one or two were noticeable for perfect starts. One of these was J. Gillett (three-speed B.S.A.); another W. A. Berry, who on a single-geared 4 h.p. Triumph got away like a catapult and made a magnificent ascent; and also G. Kelsall, whose Douglas fired within three yards of the starting line, and was quickly out of sight.

The handicap was framed by the Editor of *The Motor Cycle*, who had to place men varying in experience from two weeks to twenty years (the latter period according to B. Haywood, the former Singer light car expert), whilst the power and weights of machines and riders differed in a corresponding degree.

The course measured five-eighths of a mile, a standing start being given.

In Class I. (twenty-seven entries) the first four men were within four-fifths of a second. A. J. Dixon (an old Singer rider) appeared in Class II. (eleven entries), and rode well from scratch mark.

The twins in Class III. were not so fast as the fleetest singles, the fourteen entries being represented by six Douglasses, five Indians, two Enfields, and a Motosacoche.

The fastest time of the day was accomplished by W. A. Berry (4 h.p. Triumph) in 52½s.

Single-cylinder sidocar machines showed up well in Class IV., Triumphs occupying first and second places, with a twin Hazlewood third. King had an aeroplane strut from seat pillar to gear box on his Douglas to take up the strain when using the kick starter, and a tiny lever to raise the float needle on hills.

### CLASS I.—SINGLE-CYLINDER MACHINES WITH CHANGE SPEED GEARS.

	Actual time.	H'cap
1. J. Gillett (4 h.p. B.S.A.)	62	3½
2. C. Hodgson (1912 Triumph)	67½	9½
3. F. Raven (1916 Rudge)	66	7½
4. J. W. Hodgson (1914 Triumph)	62	3

### CLASS II.—SINGLE-CYLINDER MACHINES WITH FIXED GEAR.

1. W. A. Knight (1910 Triumph)	59	12
2. *W. A. Berry (1914 Triumph)	52½	2
3. A. J. Dixon (3½ h.p. Singer)	52½	scr
4. J. Beasley (1912 Rudge)	66	9

\*Machine not according to entry form.

### CLASS III.—TWIN-CYLINDER MACHINES.

1. R. T. M. Aysbford (1912 7 h.p. Indian)	52½	5
2. G. Kelsall (1915 Douglas)	66	17
3. R. Smith (1916 7 h.p. Indian)	55½	2½
4. J. Hobson (1914 Douglas)	69½	14

### CLASS IV.—SIDECARS.

1. T. Binns (4 h.p. Triumph)	105	14
2. V. Capon (3½ h.p. Triumph)	113½	16
3. A. S. Asquith (5 h.p. Hazlewood)	120½	11
4. O. C. F. King (2½ h.p. Douglas)	146	30

A competitor approaching the bend—the steepest section of Newnham.

# THE SCOTT SOCIABLE.

## A THREE-WHEELED PASSENGER MOTOR CYCLE OF NOVEL AND ORIGINAL DESIGN.

**SPECIFICATION IN BRIEF.**—Vertical two-stroke water-cooled engine,  $76.2 \times 63.5$  mm. bore and stroke = 578 c.c. capacity; clutch situated in fly wheel; three-speed gear, shaft drive; triangulated frame, sprung fore and aft; detachable and interchangeable disc wheels.

One of the early Scott sociables undergoing a test over rough grass tracks.

THE machine with which this article deals will create quite unusual interest in the motor cycling world not only on account of its unconventional and ingenious lines, but because it bids fair to fill the gap which the four-wheeled cycle car has as yet failed to fill. The fact that the machine is the invention of Mr. Alfred Scott, whose originality and ingenuity have been so well exemplified in the Scott two-stroke motor cycle, has already gone far in creating a feeling of

curiosity and interest towards the new three-wheeler, a brief description of which appeared in *The Motor Cycle* a few weeks ago.

When our first article was published circumstances did not permit our giving more than a brief outline of the principles followed in the construction of the machine, but the accompanying illustrations represent the vehicle on the lines on which it has since been developed as a touring car. Though improvements

will probably be made, ere conditions permit its manufacture on a large scale, the vehicle must not be regarded merely as an experiment. It was designed in the first place as a machine gun carriage, for which it is particularly suitable on account of its mobility, stability, and remarkable quickness in operation. As such it has undergone an unusually severe road test, having covered a distance of over 15,000 miles with a load equivalent to that of four eleven-stone passengers. With this load it has successfully climbed Sutton Bank, Red Bank, Kirkstone Pass (from Ambleside), Kidstone Pass, and several equally severe gradients.

The Scott three-wheeler includes so many novel and interesting features, even down to the smallest points of its construction, that to do justice to its designer we cannot possibly describe the machine fully in one issue; we propose, therefore, to deal later with those points in its design which offer peculiar advantages over existing practice.

### Why Three Wheels?

The production of this machine has been governed by certain deciding factors. In the first place it was necessary to produce a machine which presented the advantages—cheapness in production and in maintenance—of the sidecar outfit, but without the disadvantages of the latter. It must, therefore, provide adequate protection for both occupants, it must be light, otherwise it could not be cheap to run, it must be speedy, easy to handle, and cheap to manufacture.

The question, "Why three wheels?" will probably be often asked. The answer is that three-wheel construction adapts itself to triangular framework, and a triangle is infinitely stronger than a rectangle. With this point we intend to deal fully in our next issue, when it will be explained how the advantages of the three-wheel design so far outweighed its disadvantages as to leave no doubt in the mind of the inventor as to which design to adopt. In adopting four-wheel design one would have to give up advantages which have been proved in sidecar use, and adopt principles which have many times been abandoned.

CHASSIS  
SCOTT CAR

PAT. NOS. 24045 1914  
1294 1915  
11707 1915

THREE-QUARTER VIEWS OF THE NOVEL TWO-STROKE TWIN-CYLINDER THREE-SPEED SCOTT SOCIABLE.

The front guard serves as the petrol tank.

The radiator is carried in the fore part of the body.

#### The Frame.

The frame is a tubular structure throughout, and is distinct from motor cycle practice in that no brazed junction lugs are used. The frame is built up out of a number of eye-headed tube lengths, which are assembled so as to form a series of triangular structures, held at their pivot apex joints by nut and bolt fixings. The complete frame can be dismantled and packed away in the form of a bundle of tubes, which, by reference to a plan, can be reassembled to form a complete chassis.

The design of the frame is such that the tube lengths are subjected only to direct compression and tension, intermediate bending stresses, which would cause fatigue of the metal, being avoided by the application of the load only at the apices of the triangle structures.

The complete chassis may be described as consisting of the following units:

1. Bundle of eye-headed tubes, from which the frame is assembled.
2. Swing bracket, which takes the place of spring forks.
3. Back axle, complete with three radius rods.
4. Power unit, with gear box, etc., integral.
5. Four interchangeable wheels (one spare).

#### Front Wheel Spring Bracket.

The springing centres upon one system—the use of coil springs, which are cheaper, lighter, and have a greater range of action than laminated springs.

On reference to the plan of chassis, it will be seen that the front wheel swings on a steering head, which is mounted at the apex of a triangular bracket, the latter being pivoted at its base *aa* to the chassis. Viewed in elevation, the action of the bracket is that of a bell crank lever, the position of the springs being clearly shown in the upper view.

It will be seen that this construction gives immense lateral strength, so that it is impossible to twist the steering head, while slackness in the pivoted bearings *aa* would not greatly matter, since the bearings are in constant thrust. Thus chatter would not occur, even though the bearings became excessively slack by long wear, neither would this slackness

affect the steering. The arrangement would appear to have the advantages of the spring fork without its disadvantages, and mechanically it is much superior to the latter.

The back axle, which is very strongly stayed, complete with bevel box and expanding brakes, is a unit in itself.

Since the use of coil springs has been decided upon, the back axle is deprived

DEVELOPMENT OF CHASSIS (ENGINE SIDE) SCOTT CAR

**The Scott Sociable.—**

of the usual attachment to the frame afforded by laminated springs, which ordinarily restrain all side movement; consequently this movement must be prevented in some other way. This is achieved by the employment of three separate radius rods, forming, as it were, a three-point attachment for the rear axle. One acts as a propeller casing, and extends between the bevel box and the engine; its companion, of the same length, extends from the left-hand brake drum (sidecar wheel) to a bracket on the chassis; while the third lies across the frame, being pivoted to the bevel box on the one side and to the apex of the frame, close to the sidecar wheel, on the other. The two first members provide for fore and aft alignment, while the cross member takes up the side strains.

The rear springs are attached by means of a bell crank lever, there being two pairs of springs to each wheel. The action is such that the motion of each pair of coil springs is varied, and the period of recovery is also varied, so as to damp out all effects of bouncing, etc. In other words, the action of the road wheels is transmitted first to one pair of springs, which act as shock absorbers for the other pair. This system affords each wheel a more extensive motion than would be possible were laminated springs employed.

**Policy of Braking.**

The first machine was fitted with brakes acting together on the rear wheels, but on the later models the brakes have been independent. It was found in practice that when the brakes were applied to both rear wheels with the engine shut off, the engine exercised a marked braking effect on the driving wheel, and this upset the balance of things, since the sidecar wheel was not similarly influenced. The double brake was abandoned, therefore, for a system whereby the foot brake operates only

on the sidecar wheel, while the hand brake operates on the driving wheel. In ordinary use the action of the foot brake is counterbalanced by the braking effect of the idle engine, the hand brake being reserved for emergencies and for application when the machine is standing.

Both brakes are Ferodo-lined, internal expanding. Rod controls are employed, and no springs are used, the internal expanding ring being a spring in itself.

**Steering.**

Steering is by gear pinions contained in an aluminium box, and great care has been taken to ensure the castor wheel effect of

ordinary motor cycle steering, the peculiar advantages of which will be described in a succeeding article. The wheel is dished out, and allows the steering pivot to be placed so that a line passing vertically through its axis passes centrally through the tyre.

The steering wheel is so arranged that it will tilt upwards out of the driver's way when mounting and dismounting.

**Engine and Wheels Offset from Frame.**

In order to attain proper distribution of weight, the power unit must lie approximately midway between the steering and driving wheels, and this has led to a mode of construction by which both engine and wheels are carried offset from the frame.

Method of fixing the Scott detachable wheel. The outer ring is a loose collar.

On the face of things, this may appear an insecure method of mounting the engine, and so indeed it would be were it not for the ingenious triangular construction of the engine supports. These are so arranged that no side strains are imposed, the tubes being subjected only to direct compression and tension. Consequently, there is no danger of fatigue in the tubes, and this would rapidly occur were the framework mechanically incorrect in design. We may add that whether the engine be running under load or free the security of the attachment is manifest by the absence of vibration.

**Detachable Wheels.**

All wheels are interchangeable, and a very neat arrangement is employed for their quick detachment. The hub cap is provided with castellations, into which a tyre lever can be easily inserted. The act of inserting the lever pushes back against the tension of three flat springs a collar which is mounted on the cap. This releases the ratchet arrangement which ordinarily prevents the cap from unscrewing, and after giving the lever a few turns the wheel can be withdrawn. The whole process of changing a wheel occupies only a minute or so, and is a perfectly clean undertaking.

**Power Unit.**

The engine is a two-cylinder two-stroke, having a bore and stroke of 3in. x 2.5in. (578 c.c.), the bore being  $\frac{1}{16}$ in. larger than that of the Scott motor cycle engine. It is rated at 5 h.p., and its high efficiency is chiefly due to the employment of a rotary inlet valve (patent No. 1,290, 1915).

One important point with regard to this engine is that all joints are made by simply replacing the cylinder—that is to say, the one joint between the cylinder and the aluminium crank case casting performs not only its usual function, but covers also the exhaust and transfer connections, which, in usual practice, demand separate jointings. How this is accom-

Both sides of the power unit. (Left) Cover plate removed, exposing the gear box. The flywheel has been removed in order to show the skew-cut pinions which drive the load shaft and the auxiliary shaft. The gear-changing mechanism is seen in the lid of the inspection plate. (Right) General view of the power unit, which is rated at 5 h.p.

**The Scott Sociable.—**

plished is clearly shown in the sketch, which is a plan view of the flange face on to which the cylinder is bolted. E, T, and W represent exhaust, transfer, and water

W  
Flange face on which the cylinder  
beds.

E. Exhaust. T. Transfer. W. Water.

respectively. The exhaust passes from the engine into a channel contained in the crank case casting, the silencer pipes being taken direct from the lower portion of the crank case casting. Likewise, special water ducts are contained in the crank case, and the water is fed to the cylinder from below, being taken away by a water jacket connection. The engine, therefore, presents a very clean and simple appearance. The danger of leakage is also very much reduced, one large joint only being depended upon.

**Rotary Inlet Valve.**

The rotating inlet valves are contained in and form part of the crank case doors, and the induction pipes are connected to them by a ground ball joint. The valve

Part section of the rotary  
inlet valve.

consists of a case-hardened steel sleeve, which rotates on a phosphor bronze boss. Both the sleeve and the boss are provided with ports, so that when the sleeve rotates on the boss these ports come opposite each other at a given point in the revolution, and the charge is drawn through. It is practically impossible for leakage past the valve to occur, since not only the crank case compression but also the weight of the rotating sleeve tend to hold the gas-tight joints together.

The sleeve is driven round by a pin projecting from the end of the crank.

This system gives more perfect crank case compression than it is mechanically possible to obtain by the usual method, and it is not necessary to weaken the cylinder by the inclusion of a third port, only the exhaust and transfer ports being swept by the piston. These are placed at exactly opposite sides of the cylinder, and their position is so arranged that the angularity of the connecting rod causes the piston to bear on the transfer port side of the cylinder during the com-

Parts of the rotary inlet valve.

pression stroke, so that the tendency for the gas to leak by the piston at this important juncture is much reduced. Mr. Scott considers this to be a most important point, since it prevents falling off of power as the cylinder becomes worn. Skefko bearings are used where possible, and the big ends of the connecting rods are provided with double roller bearings.

**Petrol Lubrication.**

The working of the rotary inlet valve is much assisted by the petrol lubrication, this system having been adopted on account of its simplicity, and for the more plausible reason that the engine is found to give better results when lubricated in this way than when the hand pump feed, originally fitted, was used.

**Water Cooling.**

Water circulation is assisted by the use of a centrifugal pump, and the water jackets consist of aluminium sleeves which slide over the cylinders. Rubber joints are provided at the base to prevent leakage and to allow for unequal expansion. These aluminium covers are held down by the nipples in which the sparking plugs and compression taps are screwed, the nipples passing through the aluminium jackets into the cylinder heads.

**Transmission.**

The flywheel is situated midway between the cranks, and it contains the clutch. On either side of it are pinion wheels, having a 10° spiral drive, and one of these is driven through the clutch, while the other is fixed to the crankshaft. The former, which revolves with the engine only when the clutch is engaged, conveys the drive to the gear box, while the other, which always revolves with the engine, drives the magneto and also a shaft which works the water pump, and on which the engine starter operates.

The gear box is integral with the crank case, and a one-third reduction is

obtained between the engine and the loadshaft. The gear box is so designed that the only sliding feather is on the high gear dog clutch, i.e., where it is subjected to the least load. Three forward speeds are provided, a reverse being unnecessary, since the machine can be turned in its own wheelbase. By a simple arrangement it is made impossible for the driver to engage the clutch till the gears are properly home, and similarly it is impossible to move the gear lever till the clutch is fully disengaged.

Though this arrangement renders the gears practically foolproof, the writer is inclined to question its advantages from the point of view of the more or less experienced driver.

**Engine Started from the Seat.**

At the driver's right hand is placed a lever, giving ample leverage, by which the engine is started. The lever operates a quadrant which engages a gear wheel on the auxiliary shaft, and, since the teeth on these two members are skewed, the tendency is for the quadrant to force the gear wheel away from it when pressure is applied. This it does, thereby engaging the ratchet, so that no springs are required except for returning the hand lever.

From a normal position at the driver's seat the petrol can be turned on, the engine primed (if necessary), the carburetter flooded, and the engine started by a pull at the hand lever!

**Clutch.**

The clutch is a particularly novel and interesting piece of work. It consists of three members, a central cone, which is free to slide on the shaft; an inner steel ring, which is split to permit it to expand, and the flywheel itself. When the clutch is home the split ring is firmly held between the flywheel and the inner cone, and it is this ring which conveys the drive to the loadshaft.

The action of the clutch is as follows: As the clutch is slowly

Sectional view of  
the clutch embodied  
in the central fly  
wheel.

**The Scott Sociable.—**

engaged the internal cone comes slowly into contact with the expanding ring, and the friction between the bevelled surfaces slowly takes up the drive. As the pedal is still further released the ring begins to expand till its outer face comes in contact with the flywheel, which will still further tend to drive it in the same direction. When the pedal is finally released the force of the spring is sufficient to hold the cone tightly home, and it is now

practically impossible for the inner ring to rotate independently of the members between which it is held.

This clutch is extremely sweet and progressive in action, yet it can be made to grip instantly when required. It is the outcome of long experiment aimed at producing a type of clutch which requires absolutely no attention, and which, therefore, can be made so inaccessible that it cannot be tampered with.

The Scott chassis, the triangulated construction of which is rendered clear in this view.

**Points of Importance.**

As will be seen from our illustrations of the complete machine, very ample provision is made as regards mudguarding, the vehicle being as comfortable in every way as a touring car. Since the chassis is designed to withstand all stresses, the very lightest bodywork can be employed. The framework may appear to consist of an unnecessary number of tubes, but there is no superfluous tube in its whole construction. Appearances, moreover, are deceptive, since the complete framework is considerably lighter than that of a motor cycle and sidecar. The weight of the fully loaded vehicle is 5-6 cwt., or approximately half that of the alternative four-wheeler.

As regards the transmission, it will be observed that every working part is properly enclosed, while the inventor seems to have left us nothing to adjust. The clutch is contained in the crank case. Not even a corner glimpse of it can be obtained, while the shaft drive is calculated to prove most dependable.

H.M.B.

[Further articles on the mechanical details of the Scott Sociable and its road tests will appear in subsequent issues.—Ed.]

## Huge Crowd Witness High-speed Motor Cycles.

THE annual 300 mile motor cycle race was held at Dodge City, Kan., on the 4th inst. The race, which has now developed into one of the principal American motor cycling events, is held on a dirt track of two miles to the lap. The event attracted a crowd of

spectators estimated to number 20,000 or more.

The race was won by Irving Janke, on an eight-valve racing Harley-Davidson, who covered the 300 miles in the wonderful time of 3h. 46m. 36s., which equals a speed of 79½ m.p.h. In so doing

he broke the American record by 10m. 9s.

On the same day racing was held at Sheepshead Bay, where the Harley-Davidson again was successful in winning the two miles American championship.

(Top centre) A bunch of competitors just after the start in the 300 mile race at Dodge City.

(Bottom centre) Irving Janke, the winner, and Roy Weishaur, who was third, both mounted on eight-valve Harley-Davidsons.

Irving Janke (eight-valve Harley-Davidson), winner of the Dodge City 300 mile race at 79½ m.p.h.

Red Parkhurst (eight-valve Harley-Davidson), winner of the two mile American championship at Sheepshead Bay.

### TIME TO LIGHT LAMPS

" 31st	...	...	9.19 "
Aug. 1st	...	...	9.18 "

### Hoisted with one's own Petard.

It is rather amusing to note that one of the daily papers that took such a prominent part in the "pleasure" motoring campaign of a few months ago is now showing great alarm at the petrol restrictions. Doubtless the owners of the paper in question are now anxious as to the extent to which they will have to reduce the mileage of their motor delivery vans.

### The Admiral Arbuthnot Trophy Fund.

The most recent subscriptions received by the A.C.U. for the Admiral Arbuthnot Trophy Fund are the following:

Godfreys, Ltd.	...	£2	2	0
Joseph Lucas, Ltd.	...	2	2	0

## SPECIAL FEATURES

A REMARKABLE SIDECAR (Illustrated).

THE MOTOR CYCLE IN MESOPOTAMIA.

ORDNANCE WORKERS' HILL-CLIMB (Illustrated).

### The Petrol Position.

The Petrol Committee are making frantic efforts to get all the notices out by August 1st. The prospect for the civilian user does not look promising at the present time owing to the demands by the military during the present offensive having been so enormous; at one time it was doubtful if any petrol at all could be supplied to the private owner. All motor cyclists, except doctors, commercial travellers, veterinary surgeons, etc., will receive the same allowance, no matter what demands they have made, namely, two gallons per month, three monthly licences being issued. The licences are nominally available for three months—that is to say, not more than six gallons may be purchased in that time—but if the rider does not use his machine sufficiently often to ensure his consumption of the three tins during the three months, he may still purchase the balance left on his card over an extended period. On receipt of the note stating that the motor cyclist is entitled to receive six gallons in three months, he need not, unless he likes, send for his card or ticket, but may wait until such time as is convenient for him to do so.

### The Latest Ruse?

We are informed by Mr. H. Blofeld, of the Woodlands, Sydenham Hill, S.E., that a man in the uniform of an officer called on him to inspect a nearly new 3 h.p. Royal Enfield that he had advertised for sale. The prospective purchaser, who intimated that he held a commission in the Northumberland Tyneside Fusiliers, requested a trial run, which was granted. Since then Mr. Blofeld has seen neither man nor machine.

### A Midland Sidecar Outing for Wounded.

The sidecar run for wounded soldiers arranged by Mr. W. H. Carson, of the Coventry Excelsior Co., in conjunction with Mr. Fulford, of sidecar fame, was carried out on Saturday last in a very successful manner, the glorious weather contributing to the general enjoyment of the proceedings. The soldiers were taken from Coventry hospitals through typical Warwickshire scenery to Aston-le-Walls, a little village near the Edge Hills. Mr. Fulford's home is at Aston-le-Walls, and he had enlisted the sympathy of the clergy and residents of the district, the result being a very enjoyable tea and entertainment. The return journey was then commenced.

ORDNANCE WORKERS' HILL-CLIMB. J. Gillett (4h.p. B.S.A.), winner of Class 1, for single-cylinder variably-geared machines. He is shown crossing the finishing tape, the gradient here being about 1 in 6.

COVENTRY ORDNANCE WORKS  
HILL-CLIMB.

F. Raven (3½ h.p. Rudge), third in Class I.,  
at the cross roads on Newnham (see p. 78).

#### Another "Scooper."

The side-by-sidecar, the sidecar double, the sociable sidecar (call it what you will) has arrived! A runabout, designed throughout as a double-seated car, has been evolved and exhaustively tested by Mr. Alfred A. Scott, and the first illustrated description of it appears in the current issue of *The Motor Cycle*.

#### Originality in Sidecar Design.

The Scott sociable possesses more original features than any war time motor cycle yet produced, though there are a number of new designs at present undergoing test "behind the scenes." Of which more anon.

#### An Extensive Test.

The new Scott car, which is bound to create a sensation, has been tested in Government hands, and its total mileage on the road before the final design was settled upon amounts to something in excess of 15,000.

#### Naval Officers and Petrol Licences.

We have received several letters from Naval officers, who, owing to absence on duty, have not had an opportunity of filling up their petrol forms, and now do not know whether they will be able to obtain supplies. We should advise all such to fill up the necessary forms at once and state the reason of the delay. It will be very hard lines if they are debarred from obtaining their fair share owing to the circumstances outlined above.

#### "I'll have the Month."

A Bolton motor cyclist, summoned for driving to the danger, etc., at Blackpool, defended himself on the ground that his exhaust lever snapped, and to avoid a char-à-hanc he threw the gear into free position. He was about to dismount when the machine sideslipped, and he fell striking against a woman. He explained that it was a pure accident. A fine of £3 and costs, in addition to costs of witnesses, was imposed. When defendant asked What is the alternative? he was told a month's imprisonment, and his reply was, "Well, I'll have the month." "We shall want the machine," said the Clerk. "All right," was the reply. "I'll bring the machine, and I will appeal."

#### The Motor Skicycle.

A reader suggests that the motor-propelled "scooter" described in our last issue would be useful for busy departmental managers and others in getting about quickly from one part to another of a large works!

#### The National War Funds.

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£3,353,000 distributed)	£5,930,933	0	0
British Red Cross Fund .. ..	4,106,860	0	0
Tobacco Fund .. ..	110,698	16	10
The Queen's Work for Women Fund .. ..	170,093	13	9

#### Police Activities at High Wycombe.

In view of the recent fine of £2 for having a movable lamp, imposed by the Wycombe magistrate on the driver of a War Office model Clyno motor cycle equipped with a regulation Lucas lamp, it may interest the police authorities there to know that there is a small fortune awaiting them in fines and confiscated lamps if they can spare the valuable time of one of their constables to look out for the several hundred similarly equipped War Office machines now running around the country. They are all finished in khaki, too!

#### Wounded Soldiers' Sidecar Picnic organised by Ladies.

It would be difficult to conceive a more enjoyable outing than that which took place on Saturday last at Eastcote Park. The hosts were the ladies attached to Messrs. Bourne and Hollingsworth, of Oxford Street, W., and they saw to it that the wounded soldiers who were their guests wanted for nothing. The ladies had secured the assistance of about fifty motor cyclists in order to transport the wounded to the venue of the picnic, and it was quite an interesting sight to see the sidecars parked in the enclosure.

#### Despatch Riders in the Irish Rebellion.

The official despatch of General Sir J. G. Maxwell dealing with the Irish rebellion contains a tribute to the work of motor cyclists. The following quotation shows that the despatch riders undertook dangerous work: "I wish to acknowledge the great assistance I received from ... the Civilian and Officers' Training Corps motor cyclists, who fearlessly carried despatches through streets invested with snipers."

#### Motoring While They Can.

The advent of real summer weather and the near approach of limited petrol supplies resulted in a large amount of motor traffic on the main roads over the week-end. Many motor cyclists are making full use of their machines while they can get a fair amount of petrol. After August 1st many will have to be contented with much shorter runs.

#### Cycle and Motor Trades' Benevolent Fund.

A special meeting of the Executive Committee has decided to issue the usual autumn appeal to the trades by means of a presidential letter, the course adopted during the last two years, instead of by a dinner. Of fifty-seven councillors who replied to the circular seventeen were in favour of a banquet, twenty-eight against, while twelve preferred to leave the matter to the committee.

#### "Six Gallons for Three Months."

During the past few days the words that have been on all motor cyclists' lips are the above. Everyone appears to be having allotted the same amount, whether he uses his machine for business or pleasure. For instance, Mr. T. Goldsworthy-Crump, district surveyor of the Taunton Rural District Council, has been allotted this apparently standard amount, though he asked for twelve to fifteen gallons per month.

Some of the hostesses and guests at the Eastcote Park wounded soldiers' picnic, referred to in a paragraph above.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### How to Clean Overalls.

Sir,—Overalls can be cleaned by scrubbing with Fels Naphtha soap and sponging with clean water. A better job can be made by soaking and rubbing with this soap, drying in the open air. My motor coat, which would have been cast aside as useless, has just taken a new lease of life.  
F.C.H.

#### Courtesy!

Sir,—We hear so many complaints of the high-handedness of the police that an instance to the opposite extreme may be of interest. I was driving a 7.9 h.p. Harley-Davidson combination through Guildford the other evening, and in entire forgetfulness of ten-mile limits, I dropped into second gear and came up that hill nearly all out. I was neither blinding nor showing off, but I do like to swing a machine up a sharp pimple like Guildford at a good speed. Nearly at the top, out steps the man in blue; then I realised what a fool I was. Judge of my surprise when, after accusing me of coming up the hill at nearer forty miles than ten, he urged me to be more careful in future, etc., etc.! I thanked him for his courtesy, and drove on in absolute amazement. I think motorists should know when the police treat them well, and take extra precautions on those occasions to observe the law.  
AUBREY HARRIS.

#### A Butcher's Sidecarrier.

Sir,—I saw in a recent issue of your paper several motor cycle business turn-outs. I enclose you a photograph of my turn-out with two live lambs in the box.

The cycle I am riding is the big 4 h.p. Norton, chain and belt drive, which I consider has no equal for pulling power and *real* hard wear. I have an intimate friend in the motor cycle trade, so I have had the pleasure of riding various makes, but never one that has equalled mine. This machine has been in use every day for the last seven months, delivering goods every morning over very hilly and shockingly bad roads, but it keeps up its work marvellously. I fetch all manner of live stock, and have had five pigs nine weeks old in the box. I have gone on long journeys into Wales at week-ends. The box can be detached in about three minutes and a pleasure sidecar attached. The front of the box is fitted with a lid as a receptacle for carrying tools, etc.

I used to keep a horse, but I found the motor cycle was cheaper, less trouble, and far more speedy. I do the round in about one-third the time, and that alone is something in these short-handed days. I live amongst the Cheshire hills, on the borders of Derbyshire, but the Norton climbs them all with perfect ease. The carrier was designed and built by T. Linuster, of Macclesfield.

W. JACKSON.

#### Sidecars as Taxis.

Sir,—Your article in last week's issue on the sidecar de luxe has made me wonder why, in these days of petrol economy, motor bicycles and sidecars are not being used occasionally in place of taxis.  
W. G. ROBERTS.

#### Distribution of Weight in Sidecars.

Sir,—In looking through some back numbers of your excellent paper I noticed a letter from Mr. A. J. Sheppard, in your issue of June 29th, which I had not noticed before. I trust Mr. Sheppard is not rejoicing in what he must think a "significant silence." His letter is interesting, but rather self-contradictory. He begins by saying that he has tried scientific distribution of weight, but, discouraged by the erratic steering, discarded it in favour of the slipshod un-mechanical method.

Then follows a most interesting and unique list of measurements. He states that "the line of sidecar axle" is 4in. in front of the back axle of the machine. Does he not know that the sidecar wheel and driving wheel should be coaxial, and should pivot about the same point when turning corners? A most enlightening experiment for Mr. Sheppard would be to turn a right-hand corner on a sandy surface and note the furrow ploughed by his sidecar wheel.

Then he actually admits that he has broken "the back bottom stay on which the sidecar chassis is fixed" "even" with the weight distributed in his novel method. He says the front of the seat is 14in. in front of the sidecar axle. This is not very helpful to one unacquainted with the length of the seat.

What is the life of a tyre on his sidecar wheel? I have written to my friend, Mr. Corke, who has been driving the outfit described in my previous letter, and you will no doubt hear from him in due course.

H. ST. V. ADDENBROOKE.

The sidecarrier mentioned in the letter from Mr. W. Jackson.

*Write for a copy!*

It will interest and  
repay you.

# New Imperial

*Is the Machine of  
Perfect Dependability*

Renowned for Economy on petrol, oil, and tyres;  
Ease of Control; Speed on the Road; Compact-  
ness of Design and Comfort; great Accessibility;  
Capacity of long and arduous Touring.  
Don't take risks—insist on a "New Imperial  
Light Tourist."

Prices: Two-speed .. £38.  
Two-speed, Clutch and  
Kick Starter .. £44 8s.  
Lady's ditto .. £46 8s.

Makers: New Imperial Cycles Ltd., Birmingham.

The New Imperial is just the machine you want nowadays because it is economical to run. And if you buy it from us it is equally economical to pay for, because we will sell it to you on the monthly instalment plan. Our terms you will find most generous. For instance, for the No. 1 two-speed model at £38 we should want a cash payment of £8 and twelve monthly instalments of £2 13 9 subject to bonus. Other models can be supplied on proportionate terms, and second-hand machines, if they are saleable, are accepted in part exchange. Write to us for further particulars or advice; our experience is entirely at your disposal.

## "TANPILLION" MOTOR CYCLE SEAT.

### MOTOR CYCLISTS!

Take your friend in comfort, whether a Lady or Gentleman, by fitting one of the latest "TANPILLION" IMPROVED SPRING SEATS.

### WILL NOT ROLL.

Adjustable to fit carriers 7in. to 10in. wide with clamps to miss pannier bags.

PRICE 15/- EACH.

Manufacturers: FRANK ASHBY & Co., ETNA WORKS, Birmingham.

## BOOKS for MOTOR CYCLISTS.

### Hints and Tips for Motor Cyclists.

Full of useful "wrinkles" with regard to the care and management of motor cycles. Every part of the machine and every aspect of its use are fully covered. 10 all nearly 1,000 hints and tips are given.

Price 1/- net. By post, 1/2

### Tracing Troubles.

Motor Cycle Faults, their identification and their remedies, simply and fully explained. Written in simple language by a practical motor cyclist of long experience, and fully indexed for ease of reference. A very useful book for everyone who uses a motor cycle.

Price 1/- net. By post, 1/2

Obtainable (with remittance) from ILIFFE & SONS LTD., 20, Tudor Street, LONDON, E.C., also from all Booksellers

**A Praiseworthy Ambition.**

Sir,—I am a Tommy from the Dardanelles, just resting at a convalescent camp near Manchester through trying to stop a shell out there.

I would like to get into communication with a patron of your well-known paper, *The Motor Cycle*, residing in the Manchester district, who would care to teach me to manage a motor cycle. The reason I ask this favour is because I want to transfer into the Signal Service for further service in France.

T. BARDLEY.

**Petrol Permits.**

Sir,—Is it possible to explain on what system the petrol licences are being issued?

I made application for twelve-fifteen gallons per month, which is my average consumption, and have received a notification that I have been allotted six gallons for three months! My machine is used almost entirely for public work, and it is impossible properly to supervise a district of this size (Taunton) without a motor.

A friend of mine who uses his machine for occasional visits to the golf course has had the whole of his application granted. He applied for two gallons per month, and gets all he asked for!

There must be hundreds of others situated the same as myself, and to whom rapid and cheap transit for professional and business purposes is an absolute necessity.

T. GOLDSWORTHY-CRUMP,  
District Surveyor.

**Petrol Consumption with Automatic Carburetters.**

Sir,—In your issue for July 6th "Ixion" weighs the pros and cons of the two-lever and one-lever carburetters. Now he has left one type of carburetter out. I refer to the car type fitted with a properly designed hot air intake, viz., the Claudel Hobson. Some months back in his "Occasional Comments," "Ixion" remarked that he was taking delivery of a machine, the description of which left no doubt as to it being an A.B.C.  $3\frac{1}{2}$  h.p. 180° twin. He also gave a semi-promise to give the readers of *The Motor Cycle* the results of his tests with regard to petrol consumption, speeds, hill-climbing, etc.

Now the A.B.C. motor cycle, with its startling, yet sound, innovations, appeals to me, as it must appeal to many other readers of your interesting paper, and as this machine is fitted with the Claudel Hobson carburetter plus a well-designed hot air intake, it seems only fair to this type of carburetter and machine that "Ixion" should give his experiences.

F. MASON, M.T., A.S.C.

B.E.F.

[The article in question is in type and will appear when space permits.—Ed.]

**Spring Frames and Freak Hills.**

Sir,—I have been interested in the remarks made lately in *The Motor Cycle*, firstly by Mr. Abraham, secondly by "Ixion," and thirdly by Mr. Abraham and Mr. Bethwaite.

I fancy, through reading "Ixion's" weekly outbursts, that what he does not know about hill-climbing, freak or otherwise, is not worth knowing, in spite of the doubt expressed by both correspondents last week.

Mr. Bethwaite seems to share the opinion of Mr. Abraham, viz., that on very rough ground rear springs accentuate the roughness, whilst on moderately rough ground they damp out the roughness. This on the face of it is ridiculous.

What actually happens on a freak hill or elsewhere is that, when the rider meets an obstacle—a piece of rock or anything else—the rider is lifted, as Mr. Bethwaite rightly says. Yes, but not so far as he would be if he had a rigid frame, for the springs are compressed thereby, and on passing the obstacle the springs push the wheel down into the hole immediately (there is no chance then of wheel spin), and the rider and machine are let down gently and without rebound (if the springs are leaf springs, as are generally adopted); consequently there is no need for gymnastics.

Lest Mr. Abraham or Mr. Bethwaite should think I am as much a novice as they think "Ixion," let me hasten to say that, though I have figured in no trials or public events of any description, I have done much freak riding, and generally alone for the love of it. I know upper Wharfedale in Yorkshire and its environs pretty well, having

explored them on a P. and M., a Scott, and an Indian (rear sprung) in turn, and I did best on the Indian simply because of the spring frame.

A. ROBINSON.

**Sir R. K. Arbutnot's Sportsmanship.**

Sir,—Recent references to the late Sir R. K. Arbutnot as a motor cyclist emphasise the fact that he was the first amateur in one of the Tourist Trophy races in the Isle of Man, but other feats of his may be aptly recalled to memory at this time, when a memorial to his name and fame is being established.

He was, for example, the absolute winner in 1910 of the Jarrott Cup, presented in connection with the annual competition from London to Land's End and back—a journey in which not speed and speed alone, but accurate judgment as to speed, precise punctuality, and faultless running to the watch bring men to the front places. And in the somewhat similar, though less arduous, competition, also organised by the Motor Cycling Club, from London to Edinburgh, the late Admiral figured as a medal winner, on more than one occasion using brief leave from his ship when in northern waters to train some five hundred miles to London, merely for the fun of motor cycling forthwith back to Edinburgh with the club at Whitsuntide.

His fondness for road trials was more pronounced even than his keenness for racing, and on this side of his motor cycling activity he received, deserved, and, I believe, enjoyed, a very cordial and widespread appreciation of his sportsmanship.

F. T. BIDLAKE.

**Cooling Devices.**

Sir,—Some time ago Capt. Lindsay, R.A.M.C., gave a description of a Norton machine of his, and mentioned a cooling device. My own machine, a 1913 4 h.p. Singer and sidecar (a two-speed and clutch model), had given me great

satisfaction, but was inclined to get a little hot. I therefore designed a copper radiator, and should be very glad to hear from Capt. Lindsay how it compares with his.

Briefly, it consists of a sheet of  $\frac{1}{4}$  in. copper, cut to fit the cylinder head, and having two holes cut in it, to accommodate the valve caps. It is then bent at right angles to follow the fins, which it touches, and again bent at right angles and slotted, to go between the valve springs and the cylinder. Another piece is made of J section, so that it projects an inch from the first piece of copper, and a piece of sheet copper is deeply corrugated and placed in this space. The whole is securely riveted together. I think the sketch makes the construction plain.

I also drilled and tapped the exhaust valve cap, and fitted a  $\frac{3}{8}$  in. brass rod in it (copper was unobtainable). On this rod I fixed twelve pieces of copper gauze of a fairly thick mesh, separated by pieces of copper tubing. The whole was enclosed in a piece of thin copper tube, which had a wide slot cut down it fore and aft to let the air through. The top of the rod is threaded, and a piece of strip brass is bolted on to hold the copper tube down (see sketch).

Both these devices have proved satisfactory, and have improved hill-climbing and reduced oil consumption. I find, as Capt. Lindsay does, that the radiator will remain cool enough for the hand to remain on it while running, but when the machine is at a standstill the radiator becomes very hot. With a following wind the radiator seems to have very little effect.

L. P. PRIOR, Sec.-Lt., London Regt.

### Spring Fork Improvement.

In place of the usual parallel side links upper and lower central links A B are employed. The link B is pivoted at C to

the steering head, and at D to the cross member of the fork girder. Furthermore, it is extended in front of this pivot, and fitted with a spring E.—C. Stirk and J. Hadley, No. 10,200, 1915.

### A Wooden Sidecar Frame.

The novel suggestion here advanced is that the sidecar chassis be formed of a main member A of wood, bent to shape, and reinforced by metal flitch plates B C on either side. The axle member D is similarly formed, and is attached at both ends to the member A by tenoning, and is further secured by metal brackets E F. These brackets are secured by clips G, and serve to clamp the rear springs H, whilst each bracket also is formed with a split socket J—one for the sidecar wheel and the other for the attachment to the motor cycle. At the front further attachment means K are provided, and a transverse spring L is carried, which supports the front of the body.—H. S. Harvey, No. 8,875, 1915.

B22

### A Useful Sidecar.

This sidecar has been designed to afford considerable carrying capacity for luggage, and at the same time to serve for use as a bed. The body A is provided with a hinged back B, which can be lowered into a horizontal position when desired for sleeping. The luggage carrying boot does not extend right to the front, but is

parted off at E, so that two separate compartments are formed for the carriage of smaller articles. Doors are fitted where required, and pivoted metal straps F are provided to support the hinged back B when in the horizontal position.—A. Timpe and W. A. Mercer, No. 11,855, 1915.

### An Auxiliary Attachment.

This attachment resembles a Werner motor cycle, the engine A being mounted in front of the head B, and driving the front wheel through a belt

C. The feature of the invention, however, is the fact that the engine, etc., is carried upon a spring fork D attached by links E to the ordinary fork end F. The exhaust pipe is shown at G.—A. and E. Kruger, No. 9,092, 1915.

### London Firm's Extension.

Godfreys, Ltd., have secured a large garage near their headquarters in Great Portland Street, W., and are prepared to store motor cycles for riders wishing to leave their machines in safe custody for extended periods.

### New Midland Repair Works.

We are informed that an engineering repair depot is being opened in Coventry by Mr. George Pilkington, who was with the Rex Co. for a long period. The title and address of the concern are George Pilkington and Son, 123, Allesley Old Road, Coventry.

### Delivery Delays.

Owing to the extremely congested state of the railways, difficulties are being experienced by C. Binks, Ltd., in delivering promptly their new fuel. The firm tell us that they have instituted a special department to deal with this new branch of their business, and that fuel is despatched on the same or the day following receipt of order, but in spite of this delays occur for the reason mentioned.

### Magneto Repairs.

The Rimbaken Co., of Manchester, has recently been placed under Government control, but the repairs and spare department is still able to give prompt attention to orders, and undertakes to return any magneto with a fully-guaranteed repair within forty-eight hours of its receipt.

### A New Tyre Filler.

"Puncturene" is the name given to a preparation for the repair of all inner tube leaks. It is inserted in the tube via the valve in liquid form. We are told that it is not injurious to rubber, and that when an inner tube is charged it will last for twelve months. Puncturene is marketed by Mr. S. Bakes, Little Horton, Bradford, Yorks.

### Reviews.

The Graded Road Maps of England. Section 47. Lancashire. Gall and Inglis. 1s. 8d. An exceedingly clear map of undoubted value to the motor cyclist. Black triangles show the positions of the serious hills, the purple lines indicate tramway lines, yellow lines the fast and good roads, and the blue lines roads which are exceedingly rough and hardly worth attempting except for a definite purpose.

### The Easting Sidecar Hood and Screen.

We are informed that a company is in course of formation to place on the market the Easting sidecar hood and screen, described in our issues of July 6th and 13th. Central offices will be opened very shortly in Birmingham, and it is hoped to commence deliveries within a week or two. In the meanwhile communications should be addressed to Mr. C. A. Easting at 59, Abbey Road Warley Woods, Birmingham.

RELIABILITY  
of the

RICH

DETACHABLE  
Tubes & Covers

4,500 miles on a RICH Tube without using the pump. This absolutely unsolicited testimonial can be seen with a thousand others, at our office; also hundreds of ends of all other makes—British and Foreign—with the opinion of the riders.

Testimonial.

Gentlemen, Highgate.  
Please send me a Rich Tube. I must mention the one I tried and have in use since 1911 is still acting splendidly, and I am now transferring the present one to the front, and fitting a new one to the back. They are a boon.

## READ!

### MY 3-PHASE JET DAMPING CARBURETTERS

have such perfect vapourising properties that they enable you to use fuel at 1/10 per gallon in 42-gallon casks, which you are allowed to keep on your premises. Your engine will tick over dead slow, and pull dead slow in traffic, yet give the full power. It is almost impossible to tell you are not running on petrol at 2/9 a gallon. It cannot damage your engine or soot it up, and makes Motor Cycling possible in these times.

I give you my personal assurance of the truth of what is stated above. Please send at once for full particulars of the carburetter, and also for my Treatise on Carburation, and terms of One Month's Approval Trial.

# "Bowden"

## A Question of Choice.

The importance of "Choice" is demonstrated nowhere on the motor cycle so emphatically as in the Control Fittings.

Upon their perfect action and instantly-efficient response to the rider's will depends his safety, comfort, and confidence with the wheel.

Hence, in your case—when fitting-up or replacing—choose wisely from the

## BOWDEN BRAKES, CONTROLS & WIRES, etc.

—the Specialities that—by virtue of their strong design, careful manufacture, and beautiful finish—bear an unrivalled reputation for Reliability and Durability.

Made in a comprehensive range to cover every possible need, "BOWDEN" Tyseley, Fittings are thoroughly tested before leaving our works, to ensure the highest possible efficiency in service.

Write us at once for copy of our new 48-page Art Catalogue—brimful of illuminative BOWDEN information.

# Tyseley

R.H.S.

In answering these advertisements it is desirable to mention "The Motor Cycle."

B23

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

ROVER and sidecar, slightly used; cost £90, £26/10.—Colmore Depot, 31, Colmore Row, Birmingham. [X]

T.T. Rover, 1916, 3 1/2 h.p., Philipson pulley, tools, in condition as new; £49.—Wauchope Shoe Lane, London. [8]

1915 Rover, countershaft 3-speed gear, perfect condition throughout, all accessories; price £40.—Bowler, H.A.C., Canterbury. [8]

ROVER Motor Cycles, 3-speed countershaft in stock for immediate delivery; no waiting, more Depot, 261, Deansgate, Manchester. [8]

ROVER, 1912-13, 3 1/2 h.p. Armstrong 3-speed clutch, in excellent condition, enamel and like new; £28.—Clayson, 27, Bridge St., Northampton. [8]

ROVERS in stock for immediate delivery: countershaft, £66/10; T.T. 3 1/2 h.p., with 1 son pulley, £56.—P. J. Evans, John Bright St., Birmingham. [8]

ROVER Combination, 3 1/2 h.p., 3-speed, £55/10, meter, 3 lamps, 2 generators, new condition spares, Dunlops; 42 gns.—9, Compton Av., Cam Lane, Islington, N. [8]

ROVER, 1914, 3 1/2 h.p., T.T. model, an excellent fast and well-preserved machine, good in way; approval with pleasure; £36; bargain.—L Garage, Bicester, Oxon. [8]

ROVER, 1913, 3 1/2 h.p., clutch model, complete set, horn, etc.; £26, no offers; lightweight exchange.—Geo. Smith, 268, Lavender Hill, Ch. Junction. Phone: Battersea 1271. [8]

IDEAL Sidecar Combination.—Late 1913 Rover speed model, guaranteed perfect order and condition, used very little during war, very fast and full; £36 secures this wonderful bargain.—Brown cester Rd., Chesterfield. [8]

1915 Rover, countershaft 3-speed, 1,200ft. F.R.S., Watford speedometer, horn, rear etc., 1916 Canoelet model D4, hood and screen cage carrier, apron, and wings, absolutely 1916/5/10.—Lawrence, Builder, Carey St., Reading. [8]

## Royal Ruby.

ROYAL Ruby in stock for immediate delivery with the famous 2 1/2 h.p. 4-stroke J.A.P. countershaft 2-speed gear, Dunlop tyres, etc.; £1. The Premier Motor Co., Aston Rd., Birmingham. [8]

## Rudge.

1912 3 1/2 h.p. Rudge, free engine, good condition.—R. E. Jones (Garages), Ltd., Swansea. [8]

RUDGE, 3 1/2 h.p., free engine, all in good condition; offer.—455, York Rd., Wandsworth. [8]

3 1/2 h.p. Rudge Multi, I.O.M. model, late 1914 32 ometer; £38/10.—47, London St., Gloucester. [8]

## The Petrol Allowances.

**T**HE petrol licences which have been issued to motor cyclists mean a great curtailment in the use of motor cycles. Half a gallon a week is an extremely meagre allowance, though motor cyclists are lucky in having the most economical form of motor conveyance extant; and they will be able to cover a mileage which should, if they so desire, equal or even exceed that of car owners, who are to have one and a half to two gallons of spirit allotted to them for use during the same period.

Needless to remark, very few are convinced of the necessity of such drastic limitations, and consequently motorists do not take kindly to the new scheme. Many, especially the pleasure riders, would have preferred a more liberal supply during the summer months, even at the expense of total prohibition at the end of September, but this would not have suited those who ride throughout the year for business or professional purposes. A certain amount of rest is absolutely necessary to busy men, and those who have been lucky enough to take their holidays before the petrol permits came into force have been able to journey in a most pleasurable manner, viz., by road. Now, however, a motor cyclist must go to his holiday resort by train, which is not in the interests of economy, as train fare is much in excess of the cost of riding a motor bicycle.

A good deal of dissatisfaction exists in the car world by reason of owners having received different allotments though their estimated requirements were the same, and the purposes for which the petrol was required also tallied. Among motor cyclists the main grumble is the very small amount issued, and business men have good cause for complaint. Commercial travellers, road surveyors, and tradesmen, as well as men engaged exclusively on war work, in the course of which it is necessary for them to cover considerable distances, have all been treated on the same level as joy riders. Why, therefore,

were they asked to state the purpose for which they required the petrol?

## Conserving Petrol Supplies.

**A** WEEK or two ago we dealt with the method of bench testing motor cycle engines at the A.J.S. factory by coal gas, and suggested that other manufacturers might well follow suit in order to conserve the supplies of petrol. A reader followed with a statement that every specimen of a certain aeroplane engine uses up thirty-two gallons of petrol during its test. We, therefore, drew the attention of the Petrol Control Committee to this subject. The reply received from the secretary is as follows:

"I am to express the thanks of the Committee for the suggestion contained in the articles in *The Motor Cycle* of July 13th, referring to the use of coal gas as an economical means of testing motor engines, and, further, for the publicity given to the suggestion."

Whilst the above is satisfactory as far as it goes, we would have preferred that the Petrol Control Committee had been able to state definitely that it was taking active steps to bring the matter strongly to the notice of engine makers. If the suggestion is good, then official action should be taken without delay. There is nothing really new in the idea, and no doubt every engine maker is acquainted with the possibilities of using coal gas. What is necessary is that the Committee should display sufficient energy to go out of its way to bring the uses of coal gas for bench testing engines directly to the notice of the managers of the largest engine-making concerns. There are many other sources of waste into which we need not go, such as the ceaseless parade of empty lorries on our main roads which often pass other empty lorries going in the opposite direction. It would not require much organisation for one lorry to do the transport work of two in cases of this kind.

# The King of Spain Witnesses a Sidecar Race.

A Well-contested 130 Miles Road Event.

## ROAD RACING IN SPAIN.

Winner of the 130 miles championship sidecar race. A Harley-Davidson machine and Dunlop tyres.

H.M. the King and Queen of Spain in the Royal box.

The James representative, who, with his wife as passenger, "toured" round the course.

A 130 miles road race for sidecars, held in Spain on July 17th, was honoured by the presence of royalty. A special stand was located near the replenishing pits, and H.M. King Alfonso, Her Majesty the Queen, and some of their children were present during the race. His Majesty also showed his interest in the proceedings by presenting a cup, which was won by a Harley-Davidson team, the riders being I. Iiviria, Marti, and Landaluce.

The course consisted of two circuits of the Guadarrama and Navacerrada course (total distance, 130 miles). This entails two big climbs of 4,500 and 5,000 feet respectively. The starting point was at the Puerta de Madrid.

There were sixteen starters, and the first man went off at 8.30 a.m. It was a glorious day, and there were many spectators. The sun was very hot, and consequently the race proved a good test for the tyres. The Dunlops fitted to the winning machines came through splendidly. The Dunlop Co. only opened a Spanish branch in October, 1914, and, naturally, they are pleased with the good showing their tyres are making.

The few neutral countries in Europe should, by reason of the fact that they are able to hold motor cycle races during the war, produce many good riders to compete in International events hereafter. We refer in particular to Holland and Spain.

## Eking out the Petrol.

Six Gallons in Three Months the Standard Allotment.

List of Articles dealing with Petrol Substitutes.

NOW that every motor cyclist, for whatever purpose he uses his machine, appears to have been granted a permit to use six gallons of petrol in a period of three months, attention will be more than ever drawn to means whereby this quantity may be made to suffice as long as possible. Extra air valves and smaller jets will not be of much use to the majority of users, who certainly use more than half a gallon a week; the only hope for the great majority is to try substitutes. There are one or two new fuels that have been placed on the market during the past six months, and the results of tests with them have been described in *The Motor Cycle*. Paraffin has been tried by many readers, and they have given their experiences in our correspondence columns. With the adoption of such severe petrol restrictions it would not be out of place, therefore, to give the dates of the issues in which have appeared experiences of users with these petrol substitutes. It will be seen from a study of these results that, by careful experiment, it is possible to obtain nearly as good results as with petrol.

### PARAFFIN AND PARAFFIN PETROL MIXTURES.

March 30th, 1916, page 307.	June 15th, 1916, page 571.
April 13th, 1916, page 359.	June 22nd, 1916, page 592.
May 11th, 1916, page 456.	

### SPOTS.

May 25th, page 501, and June 1st, page 524.

### BINKS.

April 27th, 1916, page 399.  
May 18th, 1916, page 465.  
June 8th, 1916 page 538.

Although not making a great difference, there are one or two points that should be watched in order to avoid wasting any petrol or petrol substitute.

In these days every little helps. For instance, many machines might take smaller jets with little loss of power. Extra air devices should be tried if not already fitted, and all leaks avoided. Then it is surprising the number of people who do not turn off the petrol just previous to stopping in order to use up all the petrol in the float chamber, so preventing it being wasted through evaporation should the machine be left standing for a time.

## OCCASIONAL

## COMMENTS

By 'IXION'

Sydney R. Jones

**Stranded with Expired Permits.**

Imaginative motor cyclists are enquiring what will happen when a rider whose petrol permit is exhausted for the time being gets stranded by the roadside for want of fuel, through a petrol leak or through overestimating the distance which his remaining supply will carry him. Obviously, the Government cannot cater for our errors of judgment or our misfortunes. If it did, astute riders of uncertain morals would get stranded every time they went out, and fall back on the emergency regulations. We shall have to choose between chance generosity, or storing our machine in the nearest farmshed and coming for it when the next permit falls due, or carrying a supply of some unofficial fuel, such as paraffin or Binks, on which engines can be started and run if they are hot when the attempt is made.

**A Bonniksen Next Time.**

I always believe in keeping on good terms with the police, and when one of the local constables accosted me the other day as I was referring to a map, I demonstrated the many novelties on my A.B.C. to him, as he evidently had a smattering of mechanical knowledge. Suddenly his eye spotted my Watford speedometer, which on all A.B.C. machines is calibrated to 80 m.p.h. for reasons which need not be laboured here. He looked at me very meaningfully, and said, "I see I must keep a special eye on you!" I have not owned a Bonniksen speedometer yet, but unless memory betrays me, their needles go round and round the dial *ad lib.* instead of registering such accusing digits as "80." Anyhow, I ask Mr. Bradshaw if he considers it wise or kind to give his customers away to the police so completely. I feel quite nervous now whenever I go out. When I get my "C" model A.B.C. after the war, I shall specify a speedometer calibrated in kilometres, and I can then explain to any too interested policemen that eight French kilometres go to one English mile, or some such lie. It can only be a matter of weeks before that constable catches me doing a mild 30 m.p.h. up our local pimple on second gear ( $9\frac{1}{2}$ ); and as the exhaust is healthy under those conditions, I am sure to be charged with doing 60 m.p.h., and fined accordingly. [Better get one calibrated in Russian versts, or Greek parasangs; after the war some of our police will know what a kilometre is.—Ed.]

**Choose your Load Carefully!**

The very day on which I perused the special side-carrier number of *The Motor Cycle* I viewed a smash which has a moral. A certain dealer in antiques has looted his local town bone-dry of Lowestoft, Chippendale, Toby jugs, Morland prints, and all those other treasures for which he is accustomed to pay such wee

sma' sums to ignorant owners, and extract such gigantic cheques from wealthy Americans. So he next commenced to hunt the local countryside, and found that some of the farmhouses and cottages, which had long remained in the tenancy of one family, were perfect treasure houses. After wearing out a pony and trap, he invested in a motor cycle and sidecar, extended his range, tapped new sources of supply, and kept his window and coffers well replenished. At last Nemesis attacked him. He had paid his third visit to a cottage, wherein resided a genuinely antique old lady, short of ready money, but nevertheless the obstinate possessor of a glass case of old china which made his mouth water. Having an old age pension and simple wants, she was loath to part with her heirlooms, though ignorant of their value. But at last war prices began to squeeze her a little, and the third call saw Treasury notes pass, and the china transferred to the sidecar. *En route* home Quinney took a left-hand corner too fast. The china certainly looks older than ever, but barbed wire entanglements of rivets all over its surfaces have hardly enhanced its value.

**Cleanable Sparking Plugs.**

Several correspondents with large boxes of odd sparking plugs worth a sovereign or two, and only requiring a thorough clean to restore their pristine efficiency, endorse my demand for a really cleanable plug. One of them, an electrical engineer, writes very learnedly of the weakening of the spark due to leakage over the surfaces of insulators which are not really filmed with black carbon, but merely stained brown, or roughened, or becoming porous. He failed to obtain even a faint spark in air from a pair of comparatively new 4s. 6d. plugs of the fixed insulator type. So he took them entirely to pieces, cleaned them meticulously, inserted fresh asbestos packing, and tested them in a Wheatstone bridge testing set, when the insulation proved perfect, and the plugs are now behaving better than ever. Speaking as an ignoramus in these matters, it appears to me that the joint between the barrel and insulator is merely a compression joint. The amateur motor cyclist is necessarily trusted with the maintenance of many compression joints, *e.g.*, at his valve seatings, valve cap seats, sparking plug washers, and compression taps. Why should we not be trusted with one more? Is there some abstruse electrical justification for the scrapping of thousands of plugs annually simply because they are difficult to clean? Or is it with the plug makers as it is with the mustard firms? The latter make their profits from the mustard we leave on our plates; do the plug makers reap their shekels from the soiled plugs which we scrap, because for lack of detachable insulators it is a fearsome job to clean them?

## The Great Utility of a Motor Cycle.

**M**ARKET gardeners and fruit growers in all parts of the country, and particularly in the Vale of Evesham, have long discovered that the motor cycle is indispensable to them. Rapidity of movement between their offices and various plantations, markets, and railway stations is essential if they are to keep up with the rush of present day business transactions.

This year, with the great shortage of labour, the necessity of possessing rapid means of locomotion is more pronounced than ever, but during the last few months a new factor has appeared in gardening centres which has further emphasised the utility of the motor

(Top) A lady gardener conveys her employer from one holding to another on an Enfield outfit.

### How it Helps Lady Gardeners.

cycle. The factor is the advent of the well educated town girl, who from purely patriotic motives has thrown herself heart and soul into the work of producing and marketing the fruit and vegetables which the Vale of Evesham produces in such large bulk. Without her help local growers would be unable to consign to the customers those delicacies which are so necessary for perfect health. Many of the Evesham growers occupy land in various districts, some lying miles from the town.

It is here that the motor cycle is peculiarly adaptable. The push bicycle takes too much out of one, especially in bad weather, to be always advantageously used if the girl's work lies some miles from her residence. A motor cycle with sidecar

(Oval) Two lady market gardeners arrive at the scene of their labours on a sidecar.

The Enfield outfit is useful to collect empties.

**The Great Utility of a Motor Cycle.—**

attachment will take two or three workers to their destination in next to no time, while there is plenty of accommodation for lunch and tea, and, if necessary, for the various implements to be used in the course of the day's work.

Again, the employer frequently finds it necessary to communicate with another plantation some two or three miles distant, and what would occupy a horse and cart half an hour can be done by the lady motorist in five or ten minutes. And just now the old adage "Time is money" is more true than ever before. It not infrequently happens that important packages of fruit have to reach the railway station quickly, and no vehicle is quicker or safer than the motor cycle. For the carriage of empties from one part of the holding to another this means of conveyance is most useful and expeditious. In fact, in every department of the market gardener's business the motor cycle sidecar combination is invaluable, and those who have not seen for themselves the extent to which it is used in the neighbourhood of Evesham would hardly believe that it has become so indispensable.

MARY HARTLEY-SMITH.

A member of the Doncaster M.C.C., Philip G. Robinson, who now holds a commission in the R.F.C. The photograph was taken before Robinson received his appointment, and shows himself and Mrs. Robinson on their Triumph sidecar. With this machine Robinson did a good deal of Government work previous to joining the R.F.C.

## KINKY BILL (2).

Ho, yus, we 'as our little larfs when business ain't too brisk; F'r instance, there's a pal o' mine 'oo's always on the frisk. A-thinkin' out some new kybosh for pullin' feller's feet, 'E diddled me a dozen times, but Kinky got 'im sweet.

Aye, pinned 'im on 'is 'ind legs, too, and didn't let 'im go Until I'd 'ad me little grin at 'im for once; wot 'o! You see 'e tried to be a bit too smart with Kinky Bill, So Kinky ups and goes for 'im an' puts 'im through the mill.

You may remember 'ow we 'ad a picnic in a ditch Alonger Black Marias tryin' to give us both the stitch. A good deal went to glory from ole Kinky Bill that day; Regatters ain't much use to me—not that sort, anyway.

Four generations of Williamses, of Nottingham, on a Campion. The driver may be remembered by some of our readers as "Uncle Sturmev" of T.T. fame, the Sturmev-Archer gear expert, who died suddenly some time ago.

The saddle pin was squiffy, so I made a wire noose To 'old the saddle on the bar, and left some 'angin' loose. With that and other makeshift jobs I gets back to me base, And there I meets this pal o' mine, a chap called Funny Face.

Of course, 'e 'ad to 'ave a snack at Kinky Bill and me— "Charles Chaplin 'as arrived at last to see the fun," ses 'e. "Poor Charlie thought 'e do a T.T. stunt an' see it all; But fell off in a 'hurry when 'e 'eard the bugles call."

"That must 'ave took some thinkin' out," I ses; "but any'ow, This broken-winded motor bike 'as saved me life just now. "The silly fool," ses Funny Face, "and is 'e livin' still? 'Is number's up at last then," and 'e collars Kinky Bill.

'E never twigged that copper wire which I'd put there to 'old The saddle tight (and which was 'anging' down, as you've bin told).

Well, that was what up-ended Mister Bloomin' Funny Mug, The other end of it, you see, got tangled in the plug.

So when 'e starts the engine up and goes on foolin' round, Pretendin' to be wild because we got 'ome safe and sound, One cylinder was firin' and the other 'ad a "short," Which sent the current through the wire, an' so gave me some sport.

For on jumped Funny, with a grin—the last 'e 'ad, you bet— And caught a most surprisin' shock that 'e won't soon forget, It froze 'im on the saddle, fairly stuck 'im on like glue; 'E couldn't move a muscle, and 'e didn't 'arf look blue.

"That blots yer copybook," I ses. "Switch 'orf, you fool," 'e shrieks; "The perisher's a-sendin' streaks o' lightnin' through me breeks."

"I only wish," I answers back, "that you was in my place To see yerself, because, O lor', you 'ave a funny face."

At that I cracked out larfin' till it fairly made me cry To see 'ow Kinky Bill 'ad abserlootely wiped 'is eye. I let 'im go at last when my ole 'bus 'ad done 'is worst; But Funny Face don't sit down now without a look round first.

W. W. ABBOTT.

## HILL-CLIMBING IN DERBYSHIRE

SOME members of the Nottingham and District M.C.C. lately discovered a hill in Derbyshire that had not previously been climbed.

Accordingly, a few days ago a number of members journeyed out and were joined at Matlock by some riders from Sheffield. The hill starts out of the main road in Matlock Bath, and is known as the "Wap-pings." It rises from the level of the Derwent to an altitude of over a thousand feet. The surface for the first part, which winds up among the houses on the hillside, is made up of uneven stone flags, and affords little assistance to any rider whose machine has not good rubber-studded tyres. There are several sharp bends at low, single-figure gradients, some being claimed as 1 in 3 by the local inhabitants.

### How the Riders Fared.

Mr. Cohen, of the Sturmev - Archer gears, was the first to make the attempt with a 4 h.p. Norton sidecar, but wheel slip, caused by a steel-studded back tyre, brought about his downfall at the second bend. Another Norton rider was baulked by the first machine standing at a corner. Weinstock (6 h.p. Campion sidecar) conked out on

### FREAK HILL-CLIMBING AT MATLOCK BATH.

- (Top) J. Richards, on a 6 h.p. King Dick sidecar, just starting. Notice the passenger seated on the carrier to prevent wheel slip.
- (Centre) George Hunt (8 h.p. Campion sidecar) on the first steep stretch. The main road is seen on the left. The large flagstones do not render the surface ideal!
- (Bottom) Another Campion rider going well.

### A New Freak Ascent discovered at Matlock Bath.

the first attempt, though at the second, without a passenger, he reached the summit without assistance.

The sensation of the day was provided by Blake, of Sheffield, on a 2½ h.p. chain-driven Levis fitted with a Henderson sidecar, who claimed his gear to be no lower than 11½ to 1. Shedding his passenger, he came at the hill with a rush, and negotiated the bends in brilliant style. The next climb was made in quite a different manner, and to onlookers made the hill look quite easy. It was by J. Richards (6 h.p. King Dick sidecar), who came up from the bottom at a uniform rate of speed. The King Dick pulled slowly but steadily, having power in hand all the way. George Hunt (8 h.p. Campion sidecar, with Charles Campion as passenger) next tried, but failed owing to being baulked by spectators at the first bend. After a restart at the foot he came up in brilliant style.

Cohen, who had failed on his first attempt, having persuaded a friend to lend him his back wheel shod with rubber-studded tyre, made the next ascent; the result was a fast, clean climb. Others to make the ascent were G. Wilkin (Norton sidecar) and McKeggie, who made a good solo climb on a 3½ h.p. twin Brough.

## A Further Selection of Letters from Readers scattered all over the World.

**I**N continuation of our practice of quoting extracts from communications sent to us by motor cyclists in the Dominions Overseas, we give below a further collection of instructive opinions and experiences. The increasing volume of letters which we now receive from the motor cycling fraternity abroad show that the pages which we devote monthly to airing our Overseas readers' views are appreciated. A most interesting letter from Lt.-Col. C. MacLaurin, an Australian officer on active service in this country, appeared in our correspondence columns in our issue of July 20th. This gallant officer expresses the opinion that Overseas correspondents are much too severe in their criticism of the design of the British motor cycle and its capabilities as an Overseas mount. He also is of opinion that the average road conditions in Australia are much exaggerated as a rule, and that he has found many roads in England far worse than the average Australian; and adds that not only, in his opinion, are the best British machines quite suitable for Australian conditions, but repeats that they are eagerly sought after, even in spite of the high prices now charged.

### The War Zone as a Comparison.

Bad though some of the roads must be in certain countries abroad, it is difficult to conceive worse riding conditions than exist in the various war zones, where the roads for miles round are pitted and torn with shells, and churned up by heavy traffic. Despite these conditions, almost every day we hear of the remarkable performances and the unfailing reliability of the British-made motor cycles used by our despatch riders.

### Inflated Prices Again.

It becomes quite monotonous in reading through our Overseas correspondence to notice the continual grumbles which appear, almost without exception in every letter, about the exceptionally high prices charged for everything in the way of motor cycles and accessories by the Overseas agents compared with the manufacturers' home prices. The difficulty of obtaining spare parts also seems pronounced. Whilst we can fully sympathise with our correspondents, we would take the opportunity of pointing out to them that at the present time we, at home, are having quite as bad a time in these respects as they are. Petrol is almost unobtainable, even at the high price of 2s. 10d. per gallon, *plus* 6d. tax, new machines are unobtainable, except in very small numbers, at any price, while it means a tiresome delay to obtain spares. Until the conclusion of hostilities such difficulties are bound to be encountered, and Overseas riders will have to be well satisfied if they are able to purchase

British motors and accessories at all, but we all look forward to the better conditions that are sure to exist both at home and Overseas after the war.

### Spare Parts.

MR. F. S. DAVIES, Calcutta, India: "My great grievance is the difficulty in procuring spares. I consider that when a local firm undertakes the agency of any motor cycle it should be compelled by the manufacturers to keep in stock a complete range of spare parts. One does not buy a motor bicycle to have it laid up for two months while one waits for an exhaust valve and spring or tappet to arrive from England. Machines should be non-rustable for Indian use, as in the monsoon it is impossible to get a machine dry at all for weeks. In Central India the roads are composed of pressed murrum, or fine gravel, which clings and binds, and in a ride after rain the gravel clogs the guards and acts as a brake, bringing the machine to a standstill."

### Confined to a Fifteen Mile Radius.

MR. J. C. DUNLOP, Jalpaiguri District, India: "I am quite a keen motor cyclist, but the facilities for such a pastime are not very favourable here. Roads are rather narrow, with very stiff hills in places, and one has to keep to the limits of a sub-district, where fifteen miles is about the average run."

### Unreasonable Prices Charged by Agents.

MR. H. F. POOLEY, Bassein, Burma: "Advertisements are of little use to Overseas riders unless manufacturers state the prices of the articles they wish to sell. An Overseas rider is not always in a position to wait months before getting a reply, and then a further long period before the

### SIDECARRING IN NEW SOUTH WALES.

Scott and A.J.S. outfits photographed on a piece of good road near Sydney. The Scott belongs to a soldier and the A.J.S. to Mr. Cunningham, of Petersham, Sydney. In sending us the photograph Mrs. Cunningham tells us that the A.J.S. has given great satisfaction, it being often used for lengthy tours, when it carries herself, husband, and two little children.

**Overseas Opinions.—**

article required arrives in the country. . . . The system in vogue for buying machines in this country is seriously at fault, and the sport is being very much hampered by unreasonable prices being charged."

**Spare Part Difficulty.**

"B.W.," Cape Town, South Africa: "In this country we have many grievances, an important one being the question of spare parts, which as a rule one has to wait for, say, two months while the agent, who has not got the part in stock, has to write to the manufacturers for it. If the manufacturers in England when they appoint an agent insisted on that agent stocking an all-round range of spare parts, all parties would be satisfied, and it would tend to increase the sale of the particular machine."

**Riding Conditions in New Zealand.**

SAPPER F. V. THOMAS, New Zealand Engineers, Christchurch: "Coming away from New Zealand, and landing in England for the first time, the first thought is what splendid roads you have in comparison with ours. What roads I have seen around Devon and around Birmingham have been very good indeed. I should say that if one wants bad roads one has to look for them. The country here seems

trip from Dunedin to Christchurch is a most uninteresting ride of 240 odd miles. Just a few slight rises in the road, and one goes for miles without touching a lever, and can see road, road for miles ahead on the plains. The only thing to break the monotony of the ride is the water races for irrigation purposes, which cross the road every few miles. These will break more than the monotony if one gets careless, as one soon learns to one's cost. Our roads are rough, and in many places unformed, even our main roads. In winter they are in many places unrideable. So, compared with our roads, I think that home readers have little to complain about. There are always plenty of sheep, cows, and cattle wandering about the roads, too, and arguments are plentiful. We generally come off second best."

**Water Splashes.**

Mr. J. W. SYMONDS, South Grafton, N.S.W.: "Rims require to be strong for the roads here. I recently saw a man nearly killed by the wheel collapsing; he was riding a nearly new machine along an ordinary country road at a very moderate speed, and the wheel collapsed without a moment's notice. During a day's journey on the Australian roads a rider has to run through many low lying creeks 12in. to 18in. deep running across the road, which often cause a lot of magneto trouble if this instrument is set too low. The American machines seem to be getting a hold in these parts chiefly, I think, on account of their low prices."

**Agents' Charges.**

"A.A.F.," Sydney, N.S.W.: "The motor industry, fruitful a source of Overseas trade as it may seem, is being literally starved and kept back in what would be a race of progression by the greed of the agent. Prices are out of all proportion to values. Repairs are difficult to get properly and reasonably executed. For instance, I was riding my machine along a main street on a dark night when I hit a projection in the shape of a sewer main cover sticking up from the crown of the road, which cracked the crank case. I sent the crank case half to a welding specialist, and a crack 2½-3in. long was filled at a cost of 17s. 6d., and the job is not oiltight."

[A further series of extracts from our overseas mailbag will be published next month.—Ed.]

**CROSSING A SOUTH AFRICAN DRIFT.**

A 3½ h.p. Rover sidecar negotiating a difficult stretch during a tour by a party of East London motor cyclists to the Perie Mountains, fifty miles away. We wish to thank Mr. H. T. Medefindt, of East London, for the photographs.

greener and has more vegetation than in New Zealand, taking it mile for mile. Here in England one never seems to be really in the country. Just when you think things are looking peaceful and countrified you run into another small town or village. Go to New Zealand, branch off the main roads there, and before you know where you are you are miles from anywhere or anybody. The contrast is most marked. Your roads are more interesting than ours. There are more turns and scenery, more to keep one's mind occupied, so naturally more enjoyment derived. We certainly have scenery—splendid scenery—natural bush, rushing river, and in many cases no bridges. The

Hand-power temporarily replaces the petrol engine.

## TYPES OF AVON TYRES—No. 3

## “Combination”

BECAUSE the steel studs only come into action in thick grease or mud, leaving the clean-cut rubber bars to take care of dangerous dry-skids, the Avon “Combination” is not self-destructive like an all-steel studded tyre. Moreover, its double safety devices are capable of gripping on all surfaces.

Starting or stopping, climbing or coasting, cornering “hairpins” or speeding on the straight—on muddy macadam or smooth wood—this non-skid Avon is always on guard. If conditions create a tendency to side-slip or wheel-race that any tyre *can* stop, then the “Combination” will stop it every time.

And it is stronger—heavier—more durable than any motor cycle tyre yet manufactured. Note the extraordinary depth of tread, with the reinforcing layers of rubbered canvas extending down the walls, and the three-ply casing with *two plies round the beads*. No conditions are too severe for this cover and no work too heavy.

## CORNERING.

To be able to corner at speed with safety is an important matter, as well as a pleasurable feeling, and special provision for cornering is made in the Dunlop rubber studded non-skid motor cycle cover. In addition to the main rib with its large and effective staggered studs, there are two side ribs, out of which project smaller studs which, if the tyre is properly inflated, just touch the road and no more.

Should, however, there be any cant on the tyre due to cornering they come into action more strongly, or should the road be very bumpy they touch harder and more frequently, and in extreme cases the side ribs also come into action strongly, thus forming an increasing non-skid according to the necessities of the case.

## WHY THREE WHEELS?

Some Considerations which led to the Adoption of Certain Distinctive Features of the Scott Sociable.

SOME surprise exists that sidecar lines of construction have so far influenced the design of the Scott three-wheeler, described in last week's *Motor Cycle*, that it might aptly be set down as a sidecar outfit built as one unit, and the question, "Why three wheels?" is perhaps a natural one. It might be answered by another question—"Why four?"

It may be depended upon that the ingenious inventor of the Scott three-wheeler chose the right-angled triangular position of the wheels for very good reasons, and in the following article we intend to deal with some of the peculiar advantages of this interesting vehicle.

### The Advantages and Disadvantages of the Sidecar Outfit.

We have in the sidecar outfit a vehicle which, although unmechanical, has thoroughly established itself and withstood the ordeal of severe road test. Its disadvantages are: Difficulty of obtaining perfect alignment owing to its unmechanical design; exposed and uncomfortable position of the rider; the necessary strength can only be obtained by piling on weight, so that it is a good deal heavier than it need be; if the vertical alignment be correct the sidecar is apt to lift on corners; difficulty of rear springing.

Details of the internal expanding brake. The exterior diameter is 8in.

In spite of these significant defects it has proved a very desirable type of vehicle as evidenced by its popularity, while it has the following distinctive qualities to its credit: Economy, unequalled mobility, speed, simplicity, and cheapness of production. If, therefore, we can remove the former objections and still retain the latter good qualities, we clearly have a machine which will meet a popular demand.

It must not be thought that because the sidecar is unmechanical other vehicles following on the same lines are necessarily so. The sidecar outfit is unmechanical because it is a combination. Its imperfections arise from the fact that the frame of a motor cycle, which can be ridden as a single track machine, does not lend itself to withstanding the lateral strains imposed by a sidecar, and the necessary degree of strength is obtained only by stiffening up certain members so that they will resist stresses which they are badly placed to bear.

In the Scott three-wheeler the inventor has followed sidecar construction only in

so far as its advantages lie. He has produced a machine designed throughout as a three-wheeled vehicle. It is neither a combination nor a compromise, and thus lateral strength has been obtained without adding weight, while the various other disadvantages of the sidecar combination have been avoided.

### Strength of Triangular Structures.

Sidecar construction was adopted not simply on the strength of the sidecar having proved a success, but because the design offers certain peculiar advantages.

Strength of triangular structures.

Foremost, the three-wheel construction naturally adapts itself to a triangular framework, and a triangle is stronger for its weight than any other design. It is stronger than a rectangle because a rectangle needs to be braced, whereas a triangle is braced in itself. Referring to the accompanying sketch, it will be seen that there is nothing to prevent a rectangle assuming the shape shown at A under severe strain, unless it be braced as shown at B. It is then no longer a rectangle but a series of interconnected triangles. Though it contains double the number of tubes, it is no stronger than the triangle C.

A triangle cannot be distorted unless one side be lengthened or another shortened, and, therefore, if triangular construction be properly applied it may be regarded as indestructible.

The Scott frame consists simply of a series of triangles, so placed that the

End view of Scott power unit, showing the induction pipe connection and universal joint for propeller-shaft.

tube lengths are subjected only to direct compression or tension. Consequently, no amount of overloading can cause the frame to buckle. Breaking point is reached only when the strain becomes sufficient to destroy certain members by compressing them endwise, or by pulling them in two. As a comparison, an ordinary darning needle may be capable of suspending a heavy weight in direct tension, whereas a side strain (such as that imposed on the main members of many sidecar outfits) of small amount would be sufficient to snap it. To apply the simile further. If the needle be held vertical, and prevented from bending by a surrounding framework, it will be capable of resisting a surprising load in direct compression.

Here we have the fundamental law of triangular construction. A triangle can be destroyed, but in whatever direction the destructive force be applied it cannot be distorted. It was largely because the three-wheel design adapts itself to triangular construction that this form of design was adopted in the Scott Sociable.

### Why not a Tricycle?

On the face of things it may appear that tricycle construction would be the more correct, but such design presents no advantages and numerous disadvantages. In the first place, the tricycle is

Steering design of Scott sociable.

difficult to balance and to steer at high speeds, while this does not apply to the sidecar. It presents difficulties in the distribution of weight as regards the power unit, it demands the transmission of a four-wheeler, while giving none of the advantages of the right-angle three-wheeler. It is a design which many times has been adopted and many times abandoned. The sidecar has proved advantages, whereas the tricycle has not.

One great advantage in having the steering wheel more or less in alignment with the driving wheel is that this system renders it possible to retain the full advantages of the caster wheel effect of motor cycle steering. The Scott was first designed as a machine gun carriage, and our illustrations show it as it has since been developed on the lines of a touring car. As a machine gun carriage it was particularly necessary that the vehicle should retain the mobility of the sidecar outfit—that is, that it be capable of turning, "under steam," in extremely narrow compass.

### Why Three Wheels?—

The Scott three-wheeler can turn in a circle with the sidecar wheel as a stationary pivot—a state of affairs arrived at by adopting the principle of motor cycle steering. The pin on which the axle of the wheel pivots is set at the same angle as the steering head of a motor cycle, so that if a line passing through its centre were produced upwards, it would pass through the steering head on the corresponding single-track machine, and, by so doing, the castor action is still retained.

### The Question of Weight.

It is interesting to note that the framework of the Scott chassis weighs less than the framework of the Scott motor cycle and sidecar outfit. As a second interesting comparison, the power unit (which is an excellent piece of work), complete with gear box (an integral casting), magneto, radiator, etc., weighs approximately 20 lb. less than a modern 6 h.p. four-stroke power unit with its corresponding components.

### Nut and Bolt Fixings.

It was explained in last week's issue that the frame consists of a number of eye-headed tube lengths, secured by means of nut and bolt fixings. The advantages of this system are as follow: Should a tube become damaged, it is not necessary to submit the whole frame

Ordinary tube and telescopic spare tube.

for the brazing in of a new member. One or two telescopic tubes are carried as spares, and in a few minutes the damaged member can be removed and a telescopic spare substituted. The nut and bolt fixings are considerably cheaper, and permit of a higher degree of accessibility than would be possible if brazed junction lugs were used, and after severe test it has been found that the joints do not work loose. They are not, indeed, so likely to do so as the nut and bolt fixings of sidecar connections, the frame being more rigid, owing to the scientific construction.

### No Brazed Junction Lugs.

The distress of the brazer detailed to craze up the Scott frame by the use of junction lugs would be pathetic, and so would be the distress of the man paying for the lugs! If ordinary junction lugs were used, the frame would be difficult to make and costly to produce. Moreover, the brazing of complicated junctions is dangerous, as the risk of burning the tubes cannot be avoided. One burnt tube may mean a broken frame, but perhaps cost of production is the most important point. The independent tube system is cheap, convenient, and enormously strong, while it represents the bedrock of simplicity as regards construction. Given the necessary bundle of tubes, any novice could build up a Scott frame simply by reference to a plan.

The folding steering wheel of the Scott sociable.

### Single Driving Wheel.

The fact that only one wheel drives may be criticised, it being argued that the design lends itself to a two-wheel drive. The disadvantages of the latter system, however, especially as regards cost of production, far outweigh its advantages.

The weight of the fully loaded Scott outfit is 5-6 cwt., or approximately half that of the alternative four-wheeler, and therefore the driving wheel is doing but half the work, while it carries less weight.

The possible disadvantage of uneven wear of tyres is reduced to a minimum by the design of the quick detachable and interchangeable wheels, which is such that the task of changing round the wheels is a perfectly clean undertaking, while it occupies less than two minutes per wheel.

A real advantage of the one-wheel drive is that it renders it possible to set all road wheels at a slight rake. Every sidecarist knows the advantage gained in steering, etc., by having the machine leaning slightly away from the sidecar, so as to counteract the camber of the road. By setting the wheels at a rake, not only is the steering improved, but strength is gained, while it gives longer life to the tyres.

### Advantages.

Summing up, then, this novel three-wheeler offers the following advantages: Framework practically indestructible, owing to its triangular construction. No brazed junction lugs. Nut and bolt fixings, which permit of any tube being removed, and its place temporarily taken by a telescopic spare. (Should it be desired to re-enamel the frame, this can be done piecemeal.) The vehicle occupies less room on the road than the alternative four-wheeler, it is lighter, and consequently much faster on hills. It costs less than half to produce. Sprung fore and aft. All wheels set at a rake and offset from frame—instantly detachable and interchangeable. All working parts enclosed. No transmission adjustments. Substantial mudguarding and ample tyre clearance. Hand starting from the seat. Car comfort and control.

## RECEPTION OF THE SCOTT SOCIABLE.

AS was to be expected, tremendous interest has been aroused by the description in the last issue of *The Motor Cycle* of the new three-wheeled Scott sociable. Within a couple of hours of the paper being on sale, a wire came to the Editor asking for the name and address of the manufacturers,

and Friday morning's post brought a batch of letters on the subject. Everybody does not think alike on any one matter, and consequently it is not surprising that there is one adverse criticism. This comes from a private motorist (cycle and car) of ten years' experience, who, whilst appreciating the excellence of the mechanical features, says "the Scott sociable is horrible," referring to its exterior appearance.

The following is typical: "I was very much struck with the description of the Scott three-wheeler in this week's *Motor Cycle*. It embodies points which for some time I have longed to see embodied in one model. . . . I should like to place an order for one of the machines as soon as they will be available."

The Scott Engineering Co., Ltd., have received quite a batch of enquiries, though, as a matter of fact, Mr. Alfred A. Scott, the designer and builder, is not now at the works named, but is consulting engineer to the Scott Co. One man offered to go to the works at Bradford straightway and pay for a machine if he could have one.

On July 13th we described a new two-stroke lightweight Grandex machine, which has a new design of frame on the lines of the increasingly popular straight tube type. The bore and stroke of the Precision power unit fitted to this machine are 64×70 mm.—225 c.c.

The road from Johannesburg to Durban, S.A., appears to be as attractive to record-breakers as those separating Melbourne and Sydney and Launceston and Hobart, Australia. It is 470 miles by road from Johannesburg to Durban, and the best time at present by sidecar is 18h. 51m., while solo time (Indian lightweight) is 19h. 59m. Several attempts have been made to lower these times, but without success. A Douglas rider is reported to have done it in 19h.

The new 3 1/2 h.p. Quadrant power unit with vaporiser fitted to induction pipe for use of paraffin. (See next page.)

## The Quadrant "After the War" Model.

Many Departures from former Design.      A Useful Paraffin Vaporiser.

New model  $3\frac{1}{2}$  h.p. Quadrant with sloping top tube. This particular machine is fitted with a vaporiser, the design of Mr. T. Silver, enabling the engine to run on paraffin. The tank containing the petrol for starting purposes will be noted beneath the saddle.

WE speak of an "after the war" model, but our readers will join with us in the fervent hope that it may prove to be a 1917 model. At the present time many motor cycle firms are using what little time they can spare from munition work to get improved models on the stocks, and, no doubt, the motor cyclist of the future will derive much benefit, indirectly, from the experience gained on war work when the makers are able to return to their regular work.

We have been able to inspect and make a short road trial of an entirely new model, now well past its experimental stages, from the works of the Quadrant Co., Lawley Street, Birmingham.

The frame has been redesigned, with a top tube sloping direct from the head. This necessitates a broad tapering tank, which held one and a half gallons of—not petrol, but pure paraffin when we tested the machine, but of that we will speak later.

### A Smaller Engine.

The power unit is of the usual sturdy type associated with this firm, but of smaller capacity than formerly, 85 mm. x 88 mm. bore and stroke, nominally  $3\frac{1}{2}$  h.p. The valves follow the usual Quadrant practice, the inlet being situated behind the cylinder, and the exhaust on the right-hand side.

The transmission is all-chain through a B.S.A. three-speed countershaft gear, with foot-operated clutch and kick starter. A new silencer is fitted across the frame, made up of two cylinders enclosed in an aluminium expansion chamber, with outlets on either side of the centre chamber. The M.L. magneto which is to be fitted follows well-known lines, and is made by Messrs. Morris and Lister, of Coventry. The carburetter is the popular Amac, and, assuming that petrol is used, excellent running is certain; it served equally well with paraffin as the fuel. This machine, with its attractive appearance and power amply sufficient for sidecar work, should soon gain a big reputation when it comes on the market, as we hope it will shortly do.

### The Use of Pure Paraffin.

Mr. Tom Silver, who is responsible for this machine, had experiences in the use of heavy fuels in the early days of the motor industry. Now the increasing difficulty in obtaining petrol has led him again to experiment with paraffin as the "moving spirit." He has perfected a small addition to the ordinary carburetter by which it is possible to run any machine on paraffin only. It consists of a cylinder about four inches long by two inches diameter placed round the inlet pipe with a connection to the exhaust port, so that some of the hot gas passes around the induction pipe and heats the sprayed paraffin sufficiently to cause it to vaporise thoroughly before reaching the cylinder.

Vaporiser fitted to new single-cylinder Quadrant for running on paraffin. Position of small petrol tank will be noted.

For starting purposes a small tank of petrol is carried neatly set in the frame under the saddle. A pipe from this tank joins the pipe from the main tank just before attaching to the float chamber. A few minutes' running on petrol and the induction pipe is sufficiently warm for the change to be made by turning off the petrol and turning on the paraffin. The taps are conveniently placed, so that this can be done from the saddle whilst riding. We may say that we were somewhat sceptical, but a short trial dispelled all doubts of the ability to run on paraffin only.

The warming process took from one to two minutes, but less might have been sufficient, and when the change was made it was difficult to detect any difference in the running.

### Easy Starting.

When the engine had warmed up to the normal we were able to stop and restart by paddling off, not once or twice by luck, but many times, without the slightest difficulty, the engine firing within a couple of yards of the start every time. No appreciable difference in power was noticed, but we had not the opportunity of testing it on a good hill. Knocking seemed absent, although we deliberately attempted to make it knock. There are certain points to be remembered: To allow sufficient running on petrol to warm up the induction pipe thoroughly; to turn off the paraffin and turn on the petrol a short distance before stopping for any lengthy period, so that the float chamber shall be full of petrol with which to restart. When these points have become habitual running on paraffin is as easy and certain as on petrol. Many of the disadvantages of paraffin result from incomplete vaporisation, but it is claimed that as this heating system produces complete vaporisation, the faults of diluted lubrication and consequent wear in the bearings, dirty engine and exhaust, etc., are entirely absent.

### The Paraffin Vaporiser shortly to be Placed on the Market.

Any make of carburetter can be used; a longer induction pipe may be necessary, also a larger jet may be required. On the trial machine Amac jets Nos. 29 and 33 were used. The vaporiser can be fitted to any engine with very little trouble, and should soon justify its cost.

This vaporiser is fully protected, and we understand that Mr. Silver is endeavouring to put it on the market at the earliest opportunity. Motor cyclists who are interested are advised to communicate with him direct. We hope to make a more exhaustive test of both the new Quadrant and its economy device in the near future.

## TIME TO LIGHT LAMPS

"SUMMER" TIME.

Aug. 3rd	...	9.14 p.m.
" 5th	...	9.11 "
" 7th	...	9.8 "
" 9th	...	9.4 "

### Petrol Secretary's Allowance.

Mr. W. Cole, the secretary of the Petrol Committee, is a motor cyclist, and has, we understand, allotted himself petrol at the rate of half a gallon per week for three months.

### Petrol Allowances.

Some misapprehension may exist as to the manner in which the six gallons of petrol allowed to each motor cyclist for the months of August, September, and October may be obtained. Motor cyclists cannot get the six gallons just when they please; it is stated on the licence that not more than two gallons can be purchased in any one month.

### The H.Q.C.D., A.A. Section.

The letters H.Q.C.D. stand for the Headquarters Central Detachment Special Constabulary, which is a body of motorists working voluntarily for the Metropolitan Special Constabulary. Their work consists in being on duty during night raids, calling up special constables, and making themselves generally useful on such occasions. Motor cyclists for this duty are urgently wanted, and should apply to Mr. Bartleet, A.A. and M.U., Fanum House, Whitcomb Street, W. Petrol is provided for this work. Volunteers must be members of the A.A. and M.U.

## SPECIAL FEATURES

THE GREAT UTILITY OF THE MOTOR CYCLE. WHY THREE WHEELS? (Illus.)  
SATURDAY'S H.Q.C.D. HILL-CLIMB.

### An American Appreciation of the late Admiral Arbuthnot.

Mr. W. H. Wells has been good enough to show us a letter he has received from Mr. George M. Hendee, the head of the great Indian concern. Mr. Hendee writes: "I read in *The Motor Cycle* of the death of Sir R. K. Arbuthnot, and I can well imagine your grief and sorrow at losing this most noble exponent of motor cycling."

### Brighton Road Users' Note.

The Automobile Association states that the road between Shalford and Guildford, *via* Quarry Street, Guildford, on the Brighton Road, is closed owing to a subsidence. The road is likely to be closed to traffic for some time. The alternative route from Guildford to Shalford and Brighton is *via* the Portsmouth Road to Peasmarsh, and then turn left to Shalford.

### Despatch Riders in the Somme Fighting.

"The despatch riders are a constant source of wonder and admiration. Their missions are often of the most perilous, and the mortality among them has been considerable. Behind the lines one sees them all day and everywhere, pounding along on their motor cycles, soaking wet and cased in mud, or, in dry weather, covered with dust and grime, so that their features are quite indistinguishable, somehow threading their way through all the blocks and intricacies of the traffic, among horses and guns and lorries and columns of marching men. And at night, wherever one is, in the stillness or through the noise of the guns, somewhere on the nearest road the ceaseless purring of their machines goes on. Individually, I presume, they sleep some time. Collectively, they never

stop, the constant playing of their shuttles going on day and night through all the complicated fabric of the moving armies." (From *The Times*, July 27th.)

### Mr. Joynson-Hicks on Petrol.

At the annual meeting of the A.A. and M.U. held last week, Mr. W. Joynson-Hicks, M.P., chairman of the association, referred to the waste of petrol in the Services. He said that all motorists were prepared to pay their share, and even more than their share, of taxation for war purposes, but they were entitled to demand that the authorities themselves, particularly the Army and Navy, should be as economical as they possibly could in the use of petrol. Mr. Joynson-Hicks went on to say that there was no lack of petrol in the world; all that was needed was more transport to get it over here.

### Returns to his Old Love.

Mr. Oscar Hedstrom, whose name will be known to thousands of our readers by reason of his prominent connection with the Indian motor cycle, has returned to the Hendee Manufacturing Co. after an absence of three years. Mr. Hedstrom built the original Indian, and he was identified with the development of Indians from 1901 to 1913, when he retired to take up farming in New England. But his great interest in motor cycles continued too strong, and he has returned to his old love. He was the originator of the laminated springing for motor cycles, and the designer of the Indian Hedstrom carburetter, which, excepting for the addition of a pilot jet, has remained practically unaltered for seven or eight years. Mr. Hedstrom was born in Sweden, and went to the United States when a child.

MEETING A RED CROSS TRAIN WITH SIDECARS.

A suggestion made in this issue that sidecars might be used to convey slightly wounded men from ambulance trains to hospitals in order to save petrol is seen being carried out in this picture. It was taken at Coventry on Friday last, when a batch of Rudge sidecars met an ambulance train and conveyed some of the Tommies to a local V.A.D. hospital. Mr. V. A. Holroyd is on the extreme right.

**Methods of Road Repair.**

We have received information that three steam rollers are at work on the Yelverton-Plymouth road. This is welcome news, but at the present time those responsible for the work are making themselves unpopular by leaving fifty feet of heavily metalled road unrolled and unlit at night.

**An Irish Wounded Soldiers' Run.**

The popularity of sidecar outings for wounded soldiers has spread to Ireland. A few days ago a number of Belfast motor cyclists took about two dozen soldiers from local hospitals to Millisle, Co. Down. The weather was delightful, and the men thoroughly enjoyed themselves. Another outing is being arranged.

**Motor Cycle Manufacturer Wounded.**

Lt.-Col. Charles E. Scott, formerly a director of the Scott Engineering Co., and the brother of Mr. Alfred A. Scott, the two-stroke expert, is, we regret to hear, at present in hospital at the base rather badly wounded, but it is hoped that he may soon recover sufficiently to enable him to get home.

**Paraffin as a Fuel for Two-stroke Engines.**

We are informed that a reader has been running his Radco two-stroke on paraffin with great satisfaction. He obtains a better consumption and a higher average speed (twenty-four miles per hour as against twenty). He now uses the oil tank to carry petrol for starting purposes. This is connected with the induction pipe, and when a little petrol is injected the engine will start easily. After about five minutes' running the machine will start on paraffin. Our correspondent mixes a little saltpetre with the paraffin to reduce the carbon deposit, and uses a thicker lubricating oil.

Some little while ago a member of our staff made some experiments with paraffin on a Clyno two-stroke, and found it to be quite satisfactory. Both these machines used the petrol method of lubrication.

**Week-end Events in this Issue.**

The centre pages of this issue of *The Motor Cycle* are devoted to the H.Q.C.D. hill-climb, held at Pebblecombe on Saturday last. *The Motor Cycle* is the only journal dealing descriptively and pictorially with week-end events in the succeeding issue, and thus regularly provides its readers with first news.

**No More Petrol at Fishguard, Patchway, or Pilning.**

The Great Western Railway notify that it will be found necessary upon the exhaustion, on or about August 31st, of the petrol supplies on hand to suspend the arrangements by which motorists are able to replenish their petrol tanks from supplies at Fishguard Harbour Station, after conveyance of motor cars and cycles from Ireland by the company's boats, and at Severn Tunnel Junction, Patchway, and Pilning Stations, after the conveyance of cars and cycles through the Severn Tunnel.

**The Admiral Arbuthnot Trophy.**

**North London Wounded Soldiers' Run.**

Mr. H. J. Carter, 333, Green Lanes, Harringay, N., tells us that he is forming a club for the purpose of giving wounded soldiers sidecar runs on Sunday afternoons. North London motor cyclists who would care to co-operate should write to Mr. Carter.

**After the Work has been Done.**

We read in the daily press that the principal motoring organisations held a joint meeting last week, and resolved on joint action in connection with the petrol supply question. It was also resolved to offer assistance to the Petrol Control Committee. It seems rather late in the day, to put it mildly, to offer such assistance. The following bodies were represented: R.A.C., A.A. and M.U., C.M.U.A. and S.M.M.T.

**Benzole and the British Government.**

According to reliable information which has reached Lord Montagu via Denmark, the Stettiner Co., of Germany, has already erected eleven to twelve large coalite plants to increase the supply of benzole. Years ago, practically all the British automobile journals urged our own Government to move in the matter, but without result. Everybody now knows how, at the eleventh hour, the sale of benzole was prohibited, and the whole supply taken for high explosive shells. Had the output of benzole been encouraged, there would probably have been no shortage of motor spirit to-day for military or civilian purposes.

**Where are we?**

There are rumours—and they may be no more than rumours—that there is an ample supply of petrol in the country for all purposes, and that the present restrictions are simply due to the Government having the idea that the use of petrol encourages extravagance, and thus desires to force economy upon the nation. A Colonial firm, we are informed, has offered to supply 4,000,000 gallons of motor fuel per month and eight tank steamers to ensure delivery. We hope that the Government will accept the offer. The price quoted is 11½d. per gallon free on board at a Canadian port.

**Petrol Substitutes.**

With the forthcoming great petrol restrictions, motor cyclists are already beginning to experiment in earnest with other fuels of various descriptions. Many enterprising garages are already stocking, and are able to supply in either large or small quantities, white oil, which is a highly refined kerosene. When mixed with a small proportion of ordinary spirit excellent running is obtained, and if starting is effected on petrol the fuel can be used neat. If, however, it is to be quite satisfactory, some sort of vaporiser is required; even a properly designed hot air intake makes a difference. This week-end we had a most satisfactory journey on a Scott running on half petrol and half white oil. The consumption was better than on pure petrol, and the running perfectly sweet. Starting from cold was the only difficulty, and this was made easy by an injection of a little petrol into the cylinders.

A sidecarist, with a convalescent Scotch soldier aboard, crossing the swing bridge over the canal at Aldermaston. Photographed during the course of a run for wounded soldiers organised by Basingstoke motor cyclists.

## A SPECIAL CONSTABLES' HILL-C

An Inter-squad Cor

Lieut. O. C. Godfrey starting Frank Applebee (Indian)

An Enfield rider cornering well.

WHEN you see S.C. on the side of a sidecar do not think these letters are the well-known abbreviation for this type of vehicle. They stand, of course, for Special Constable. Now these particular specials, who organised an informal hill-climb on Petcombe Hill, near Dorking, on Saturday, consider themselves somewhat of the ordinary, as they have a special duty to perform, namely tear round London on raid nights call up their colleagues who do not possess motor cycles. They belong to the A.A. Section of the H.Q.C. lately commanded by Mr. Chas. Jarrott, now Capt. R.F.C., and at present commanded by Mr. C. Temperley.

The idea on Saturday was to hold an inter-squad hill-climbing competition, each squad of six men being designated by the day on which its members are on duty. As there were many novices as far as competition are concerned, though each squad consisted of six men, five only counted so that one failure should not defeat a squad of its chance. The results were worked out on *The Motor Cycle* formula.

Numerous well-known faces were to be seen. Mr. George Reynolds was at the time at the summit of the hill, Mr. W. H. Wells at the foot. Among the competitors we noticed E. G. W. (Indian); D. S. Kapadia, of the I.M.C. (Rex sc.); R. M. Brice, a veteran sportsman on a 6 h.p. J. Vincent engine, which is a production of Messrs. Brown Bros., Ltd. Charlesworth (Zenith sc.); and Frank Applebee (Indian). Among the officials at the start we noticed O. C. Godfrey.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Youths of 18 now Accepted. Next Week's Arrangements.

THE fact of youths of eighteen years of age now being accepted for the Motor Machine Gun Service has led to an increased number of applications for this popular section.

On Tuesday this week at the Recruiting Office, Coventry, and yesterday at the Recruiting Office, Nottingham, a number of men were examined and accepted for service.

Particulars of enlistment and a form for filling up may be obtained on application to the address given on this page, but it is not necessary to write. Those readers who conform to the conditions of enlistment mentioned on this page, and who are ready to join up at once, may attend any of the inspections named. Recruits coming to Coventry proceed either the same day or the next day to their training centre.

In the case of recruits living at a distance a free railway warrant will be issued if the applicant will take the trouble first to get examined before the Medical Board for his district.

The amended conditions of enlistment in the M.M.G.S. are given hereunder:

**EXPERIENCE.**—At least one year's motor cycle or car driving experience.

**AGE.**—18 to 40.

**ENLISTMENT.**—For duration of the war.

**MEDICALLY FIT.**—For general service or for garrison duty abroad.

**PAY.**—1s. 2½d. per day, all found; the usual separation or dependants' allowance.

## Applications.

In applying for enlistment into the M.M.G.S. letters should be as brief as possible, and should mention:

- (1.) Age.
- (2.) Experience.
- (3.) If called up.
- (4.) Whether fit for service Overseas.
- (5.) Date applicant could join up.

Central Office for Motor Machine Gun

Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

A list of recruits accepted prior to the new regulation admitting youths of eighteen years of age is appended:

Dean, L. W., Birmingham.  
Evans, M., Brigg.  
Goodard, N. H., Eastbourne.  
Goodwin, J., Normacott.  
Maclean, A., London.  
Matthews, J., Coventry.  
Paton, H. S., Templetonburn, N.B.  
Roberts, O. N., Pwllheli.  
Short, E. W., Sherborne.

## Next Week's Inspections.

Next week Mr. Geoffrey Smith will be at Coventry and London in order to examine and accept suitable recruits as follow:

**COVENTRY.**—The Recruiting Office, Little Park Street, Tuesday, August 8th, 2.30 to 4 p.m.

**LONDON.**—The Motor Cycle Offices, 20, Tudor Street, E.C., Saturday, August 12th, 2 to 4 p.m.

H. E. Walker writes from the Argentine Republic to the effect that he is leaving for England at the beginning of August in order to enlist in the Motor Machine Gun Service, as he has noted from *The Motor Cycle* that this section is open for recruits. Walker is an assistant ranchman, but had one and a half years' motor cycling experience in England before going to the Argentine.

## DESPATCH RIDERS AT HOME.

THERE are many motor cyclists attached to the A.S.C., M.T., in different parts of England, and it is always as interesting to hear of their doings as it is of those Overseas. Among the men stationed in the S.E.

Cpl. Eric Williams riding his medical officer's Brough.

district of London is that well-known rider, W. Pratt. He tells us that he has charge of six men, and they all get a good deal of London riding. Occasionally a run with a convoy to another camp in another part of the country comes as a pleasant change. Cpl. Pratt is much struck with the increase, since the war, of the number of careless riders and drivers on the roads, and says that he would rather be out at the Front again.

## ERIC WILLIAMS CONVALESCENT

WE had another opportunity a few days ago of meeting Cpl. Eric Williams, who is now rapidly completing his recovery at Edmonton Hospital. He is in good hands there and great interest is naturally taken in him, as many of the medical officers are motor cyclists. At the hospital there are two Villiers machines, a Brough (belonging to Maj. Taylor, R.A.M.C.) and a Rudge.

Williams had very interesting stories to tell us of the recent fighting. Thanks to lessons learnt in previous attempts to advance, the motor cyclist has not the hard work to do he had in the past, and is now used as a reserve means of communication. Williams's post at the beginning of the offensive was in a dug out at the end of a communication trench, his machine leaning against the parapet, and only once had he to carry a message on his Triumph, which, by the way, he had converted to suit his own tastes.

A.S.C., M.T., DESPATCH RIDERS IN ENGLAND.

Names left to right: Cpls. W. Pratt (Douglas) and Taylor (Triumph), L.-Cpl. Shepherd (Douglas), Cpl. Wood (Indian), and Pte. Jordan (Douglas).

# Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

## Is it in the Air?

Sir,—Regarding your article on American high-speed racing in the issue of July 27th, we should suggest that over the pond they must employ some method of their own of measuring miles. One can hardly expect the public to take such published speeds seriously, and, if so, it obviously puts our own racing men and machines in this country at a very low level.

J.H.

## Spring Frames and Freak Hills.

Sir,—Regarding Mr. Robinson's letter dealing with spring frames for freak hill-climbing, I might say that I do not doubt "Ixion's" abilities. What I say is that Stoneythwaite Rake is an exceptional hill, and will surprise most motorists when they see it. Seeing that he believes so much in the spring frame for freak hill-climbing, I should esteem it a great favour if he will let me know (if he would like to try his spring frame on Stoneythwaite Rake) when he intends doing so, as my friends and I will surely be there to watch him.

J. G. BETHWAITE.

## Petrol Permits.

Sir,—From this week's *Motor Cycle* I gather that all motor cyclists, whatever their use of machine, have been given a licence for only two gallons of petrol per month. That is my own case. My work is in no sense "private riding," much less "pleasure riding"; it is entirely in the service of the Missions to Seamen, which is at present doing a very large work amongst the naval men—in fact, a well recognised "war object." I have to travel extensively, and quite often in country places difficult of access by railway.

In my form I filled in my name, and added, "Representing the Committee of the Missions to Seamen," explaining also that my riding is *entirely* for the society. My average is 700 or 800 miles a month, and I asked for twelve gallons of petrol per month. It is nothing less than a scandal that such treatment should be accorded to a purely professional use of a motor cycle.

(Rev.) F. C. LEES.

Sir,—I have been notified by the Petrol Control Committee that my supply of petrol for the next three months is restricted to six gallons. I am wondering why we were asked to give an estimate of our requirements at all, as all the motor cyclists in my district seem to be allowed the same quantity, irrespective of the type of machine they ride, or the purpose for which it is used. The owner of a lightweight, riding fifty miles per week for recreation, who asked for eight gallons, is given six.

I am a commercial traveller, employed by a firm in one of the reserved occupations, averaging 250 miles per week, mostly on business in connection with Government work, and I also am permitted to have six gallons as against my estimate of thirty-six gallons. This is not much more than 15% of my requirements, whereas a firm which lets cars on hire is granted 50% of the quantity requested. I have no doubt you will be inundated with complaints similar to this, and I hope to hear shortly that the stock of petrol has accumulated to such an extent that a further allowance can be made to genuine business riders.

I might also mention that I am a special constable, and in the event of air raids have undertaken to give the neces-

sary warning over a very scattered and hilly district. This entails a journey of about thirty-five miles, and may have to be undertaken twice in a night. My half a gallon of petrol per week will not do many of these trips.

ROBERT J. COSH.

Sir,—With reference to the petrol question, a man at Wood Green has received a permit allowing him to purchase 288 gallons of petrol in the three months. He is a builders' merchant, and is connected with firms on munitions, and does carting for them by horses, etc. His application was granted because he said the carting was of national importance, and he held a motor car in reserve, and would not take the petrol unless obliged. I have seen the permit.

MOTOR CYCLIST.

[The foregoing are but a selection of the many letters of complaint received from readers against the action of what has come to be known as "the most unpopular committee" yet formed in connection with the war.—Ed.]

## Costly Spare Parts.

Sir,—In reply to a letter from R. Logan, Botany, N.S.W., in your issue of April 6th, 1916, as N.S. Wales agents for J.A.P. engines and spares, we beg to state that we have had J.A.P. valve caps always in stock. Mr. Logan could not have applied to us for the line. Our price for making a J.A.P. valve cap would not exceed 5s.

Mr. Logan's advice that British manufacturers should insist that their Overseas agents carry large stocks of spare parts, in a similar manner to the American firms, is amusing, inasmuch as the agents in this State for British motor cycles, notwithstanding the difficulty in obtaining supplies from Great Britain, carry ten times the quantity of spares carried by the agents for American motor cycles. In support of this statement, we send you separately our lists of J.A.P., Triumph, Rudge, and New Hudson spares.

BENNETT AND BARKELL, LTD.,

Sydney.

J. BARKELL, Managing Director.

[The list referred to is very complete.—Ed.]

## Storage Space required for Sidecars.

Sir,—The attention you so frequently give in your paper to sidecar combinations makes them appear very attractive to the novice, but there is one matter that does not appear to have been dealt with, viz., the overall dimensions of combinations and what the minimum storage space required is. No doubt this varies with different makes. Can the sidecar be readily detached from the machine, for it should pack closer in this condition? It would be very interesting to know into how small a space the separated parts can be readily packed, for many of us have very little space, and the possibility of keeping a combination at all depends upon its going into a certain space and passing through restricted passages, so the question of dimensions is rather important.

Your article upon cleanliness, in *The Motor Cycle* for July 13th, reminds me that I have frequently seen lightweights in which the footboards are so low that with the silencer in front of the engine the exhaust gases pass over the foot all the time.

H. EDGAR PARKER.

### Petrol Waste.

Sir,—The photograph of the A.J.S. testing room in your issue of July 13th is most interesting. If gas can be used successfully for testing purposes, why should it not be used on the road? There would surely be plenty of possible methods: we have had compressed acetylene in cylinders for lighting purposes a good while now. It would be very interesting if the A.J.S. Co. could tell us how long an engine of given capacity can run on a unit volume of gas. I have heard that thirty-two gallons of petrol are used to test each aeroplane engine of a certain well-known and excellent make. Would it not be "some" saving if they used coal gas?

The experiments of Mr. Barthorp with steam motor cycles sound interesting. I should like to help him if he lives fairly near my home (Wolverhampton). I may say I have used "flash" boilers in model power boats.

"H.M.'s" sidecar body designs are very shapely and attractive; but, as he is going in for "something better," why does he not place the centre of weight of the body and passenger directly above the sidecar axle?

H. S. V. ADDENBROOKE.

### A Juvenile's Motor Cycle.

Sir,—Observing in your issue of July 20th an interesting illustrated description of "A Motor Skicycle," I would like to make a few suggestions which, to my mind, would improve and add to the safety of such a novel form of mechanically propelled juvenile two-wheeler which might replace the present juvenile bicycle.

Firstly, a miniature two-stroke engine capable of attaining about 15 m.p.h. maximum speed should be made (such an engine would run quite well and smoothly, since it seems these engines are more efficient in the smaller sizes); quite a simple three-port type would be sufficient, and this should be mounted on the back wheel instead of the front, as Mr. Maina has arranged. I believe that, in Mr. Maina's design, there would be some peculiar "over-balancing" effects when

turning sharply round a corner due to the position that the engine would be placed in, since it is a fixture to the end of the steering column, so to speak. The engine would be run on petrol for simplicity, or a sump cast on the crank case, which would be arranged in such a manner as to lubricate the engine automatically. Of course, a reducing gear would still be used from the engine to the back road wheel to obtain the suitable ratio. The saddle should be mounted in a column, which could be carried upwards from the back portion of the frame with a tie rod to the frame steering head, as shown in the rough sketch appended. The above suggestions, I believe, would bring this invention of Mr. Maina's quite within a practical form, and it could then be placed within the hands of elder juveniles, say, between twelve years and sixteen years of age, after which they would be quite capable of handling the modern up-to-date junior motor cycles. I should say that such a machine could be made and would sell somewhere in the neighbourhood of twelve or fifteen guineas—perhaps cheaper when catering for quantities.

NEWERA.

### Dust.

Sir,—Almost every motorist will have experienced riding behind some vehicle which has been raising a goodly cloud of dust. Whenever any of us have undergone it for either a

prolonged or short period it has created a good deal of annoyance. Apart from the aggravation caused therefrom, I wonder how many motor cyclists have considered how injurious this is to one's health.

Most of us are acquainted with the properties of dust, inasmuch as it oftentimes fills up the gauze protecting the air inlet of our carburetters, etc. In the same way, it finds a resting place in the nostrils and back of the throat, and anyone suffering from catarrh of these membranes will surely know that it is not good for them.

I am quite aware that motorists do not go about with their mouths wide open in the face of a cloud of dust; but, even so, Nature does not provide us with a respirator or some complete protection against this evil, as evinced when one happens to glance at one's countenance after a good run on a dry day, and observing that dirty black line on one's lips, and the gritty feeling in one's mouth.

I know that motorists, as a rule (and I am no exception) object to adorning themselves with any more wearing apparel than at present, for I am afraid that, when fully equipped, we motorists present the appearance of highwaymen, but I firmly believe that motor cyclists should protect themselves, when occasion arises, against the dust evil. If there were some simple combination made to protect the nose and mouth as well as the eyes it would certainly find favour with hygienic loving motorists.

I hope this will not alarm any of your readers, as I once heard a medical gentleman laughingly define dust as being clean dirt.

JOHN BELL.

### American Motor Cycles.

Sir,—One of the questions we shall all be asking after the war will be, "What machine shall I buy?" and I regret to say my answer will be "An American." I feel I can claim to be patriotic, but still my patriotism is not proof against the clumsiness of the average British heavyweight, and for many reasons I would not dream of using a lightweight. For too long have we been content to pat ourselves on the back and point to our wonderful  $3\frac{1}{2}$  h.p. singles, but British manufacturers seem quite oblivious to the fact that to some people a single-cylindered engine is anathema. I have owned fifteen machines during ten years' motor cycling, and I always make a point of trying every machine I can, and now I would never ride, willingly, any but a four-cylinder bicycle. The T.A.C. showed promise, and I am sure it would have had a very big sale, had it been shortened and lightened, but it was unfortunately over-developed into a 10 h.p. water-cooled affair. The average 8 h.p. twin of British make is a most impossible solo machine. I have tried a great many, and all seem to be first-class skidders, and the makers have got that particular weight distribution and steering angle that make a machine thoroughly uncomfortable to ride. My last machine was a

7-9 h.p. spring frame American-made bicycle, and was a perfect joy to ride, either in the open or in traffic. I will not enlarge on its merits, except to say that I feel it is an unfortunate fact that no machine made can touch this 1916 model. One cannot help feeling that the outlook for British manufacturers will be a desperate one soon unless they bring their machines up to date. Already the Colonies are demanding Americans, and willing to pay more for them, because they know they are the most suitable for rough work. It is time that the motor cycling press plainly told manufacturers to get out of the rut of the present conventional design. In the meantime, can anyone question the following statements?

The American has produced the first practical rear sprung frame.

The American is the first to standardise electric lighting. The sole four-cylinder bicycle is of American manufacture. Big tyres and big wheels are of American origin.

H.M.S. —.

H.E.R.

[Though we publish the above letter from a naval motor cyclist, his views must be somewhat isolated, and we think it well to dissociate ourselves from some of the opinions expressed. "H.E.R.'s" experiences of British twin-cylinder mounts were obviously unfortunate, and he has a treat in store!—Ed.]

# Where the Motor Cycle Wins.

## A Press Photographer—

Mr. J. Edge, of Liverpool—tells in "The Motor Cycle," June 29, of how he beats his rivals, who rely upon trains and cars, by using his

# ZENITH

The BIG "8" ZENITH, "Clutch and Countershaft" type, with Kick Starter, Positive Locking Clutch, longest Belt Drive, and the Infinitely Variable Gradua Gear.

Read what he says of his machine:

### An Appreciation of a Reliable Mount.

This is my second Zenith. The first, a 6 h.p., served me well for two and a half years. Then I exchanged it for one of the latest 8 h.p. machines, which I received last June, and since then I have run, mostly with sidecar attached, 2,700 miles. The original belt is still on, and looks like new. The back cover I took off at 1,850 miles, and had it re-rubbered by Bates at a cost of about 12s. The original plugs are still in the engine, so beyond oil and petrol (the latter=70 m.p.g.) I have had no other expense. In the last fourteen years I have had at least that number of machines, but the present is proving the most satisfactory of the bunch.

### EXTRACTS FROM RECENT LETTERS.

"I cannot give even an approximation of the mileage belt has done, as I ride, more or less, every day, winter and summer. Since I have had the belt I have twice toured the Lake District (it having taken me over Hooister and Kirkstoe), once through Derbyshire and North Wales, and once through South Wales and Somersetshire; also to the South and West of Scotland. A lot of my riding is done over the Yorkshire Moor and Coast roads."

"Having tested your belt and given it a good trial I think it only right to let you know the result. Since I took up motor cycling, eight years ago, I have had nothing but trouble with belts—slipping, stretching, and short life: since using the 'ZILLA' I have been quite free from all belt trouble. Anyone using a Rudge-Multi or other variable geared machine should not hesitate but use a 'ZILLA' and say good-bye to other makes."

Take the advice of experienced riders and order at once.

Address all communications to—  
**The ZILLA PATENT BELT COMPANY, Ltd.,**  
101, Great Western Street, MANCHESTER.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Two Sparks at Once.

**?** Please tell me how I can fit two plugs to each cylinder of my 7-9 h.p. road racing Indian. I have tried fitting an extra one in the compression tap hole, but, although the engine will fire quite evenly on either of the plugs, it will not fire on both at once. The magneto is a Bosch. I tried both at once by tapping the high-tension lead.—H.S.C.

The only way you can obtain a spark at both sets of plugs at once is by fitting a double pole plug in one of the orifices in each cylinder, or a special magneto. Special plugs are made by Messrs. Lodge for this purpose. Using two plugs at once may cause somewhat difficult starting and a tendency to knock at low speeds.

### Water in Jet.

**?** I have a 7-9 h.p. twin, and lately I have been very much troubled with it. I injected petrol in the compression taps, and it ran for about fifty yards and then stopped. I have had the jet out, but it seems all right. As I am a novice, I should be thankful if you would give me a hint or two upon the matter.—T.W.

We should say that the trouble is possibly due to water in the petrol, which is very difficult to get rid of, especially as it can be in the jet, and when you take the latter down it seems to be quite clear, because the drop of water in it is transparent. We should recommend you carefully to overhaul your carburettor and the petrol system.

### Timing the Magneto.

**?** (1.) Having upset the timing of the magneto on my 8 h.p. Bat-Jap, I cannot get it to fire on both cylinders. Will you kindly explain correct timing? (2.) How can I find out which cam is for each cylinder?—J.L.

(1.) Time the engine as follows: Place the ignition lever about two-thirds retarded; place one of the pistons on top dead centre, firing stroke—that is, when the piston reaches the top of the cylinder after the inlet valve has closed. Then time the magneto so that the contact points are just breaking for that particular cylinder. If you time this correctly the other will look after itself. (2.) We think you will find that No. 1 cam is the rear cylinder, but the best way to find out is to see which cam causes a spark to occur at each of the high-tension wires. If No. 1 causes a spark or a shock to be felt at the terminal which goes to the rear cylinder, then you know just how you stand.

### Excessive Knocking and Vibration.

**?** I have a 1913 three-speed single which, owing to excessive engine vibration and severe knocking, has never been satisfactory. I sent it to the makers, who re-bored the cylinder and fitted new piston. For a time the knocking disappeared, except when picking up, so I lowered the compression with a plate between the cylinder and the crank case, which slightly improved matters. It has gradually been getting worse, until now, after less than 1,000 miles, it knocks and overheats far worse than ever. I took it down and discovered slight play in the gudgeon pin, and two very bright places in the skirt of the piston, also one very black place about 1½ in. long in one of the rings. I filed the bright places down and put the piston back, with very little improvement. My repairer suggests that he fit a new piston, with one ring at the top and one ring at the bottom, and not cut away in the waist. (1.) Do you consider this would improve matters? (2.) Are you in favour of this kind of piston? I have bought an Amac carburettor, but, unfortunately, it is too large to fit on the inlet pipe. (3.) Do you consider this would be an improvement on the present one, which is an old pattern?—M.H.

A knock is a very difficult trouble to trace without actually seeing the engine. The play in the connecting rod should be taken up, as this would cause knocking. If the piston has become distorted it might also cause the trouble. We would

not advise a different type of piston from that already fitted, as the difference in weight might upset the engine balance and so render vibration worse. Your filing the piston would be likely to do more harm than good. (1.) No, we do not fancy this would remedy your trouble. (2.) We prefer the waisted type with all rings at top. (3.) The trouble may lie in the carburettor giving too rich a mixture, and so causing overheating. If so, a change of instruments might effect a cure.

### Four-stroking Down Hills.

**?** Please answer me the following questions: (1.) Why does my 2½ h.p. Levis, single speed, four-stroke down hills or down a small incline? Moving the controls does not end the trouble. (2.) Why does oil come out of the hole in the filler cap when the machine is running? (3.) What does ten miles per hour really mean? Does it mean a certain machine has gone ten miles in one hour or touched ten, e.g., S. George went ninety-three miles per hour on an Indian at Brooklands? Does it mean he travelled ninety-three miles or touched ninety-three miles?—C.R.

(1.) A two-stroke is always inclined to four-stroke when running light, though the trouble may be accentuated by having too rich a mixture. Try a slightly smaller jet. (2.) This is probably due to vibration. (3.) It may mean that so many miles are actually covered in one hour, or it may only mean that a certain distance, usually not less than a kilometre, is covered at such a speed that so many miles would be covered if the speed were maintained for one hour. The distance over which the record is made is usually stated.

A French military motor cyclist, holding the rank of Etat-Major, who has contributed from time to time to *The Motor Cycle*. His mount is one of the latest Triumphs.

**Local Taxation Licence.**

**?** Would you kindly answer me the following question, viz.: I took out an Excise licence in January for my motor cycle (a Rudge Multi). I have since exchanged the Multi for an L.M.C. Shall I have to pay another local taxation licence for the L.M.C.? I have received a notice to that effect. —W.B.

No. The £1 local taxation licence entitles you to keep one motor cycle for the period of twelve months. If you sell it and then purchase another, the same licence holds good, provided you do not have the two machines at the same time.

**Castor Oil.**

**?** Would a good grade of castor oil be suitable for use with a two-stroke engine for lubrication purposes, and, if so, what quantity should I use as compared with ordinary lubricating oil? It is a little thinner body. I have an idea that the castor oil would be cleaner in use than ordinary lubricating oil. —E.R.

Castor oil is quite unsuitable for the lubrication of motor cycle engines, and we do not recommend you to use it under any circumstances. It is true that castor oil is used in aeroplane engines, but these are so frequently taken down and cleaned that any evil effects it may have upon metals are removed.

**Petrol-paraffin Mixture.**

**?** Re petrol-paraffin mixtures, kindly inform me on the following: My machine is a standard 2½ h.p. Douglas, T.T. model. I have not altered it in any way; have not touched plug gaps, or interposed gauzes in induction pipe. I have a 24 jet in Amac. I know it is rather small, but I get good results, 112 m.p.g. and 47 m.p.h. on petrol. I am making a hot air intake to help small jet. I have been trying a 50% mixture of petrol and paraffin, and get fairly good speed results, etc., on the level. With the same jet I get 100 m.p.g. and the same speed as with petrol. Kindly tell me a cure for the following: (1.) Engine slows up quicker on hills than with pure petrol. (2.) When accelerating on a hill it does likewise; of course, closing air cures to some extent. (3.) After your tests, do you consider Binks fuel better than a 50% mixture of petrol-paraffin? (4.) Does it evaporate at atmospheric temperature? (5.) Is it possible to start up from cold? I might add I can start up from cold on a 50% mixture easier than on petrol. —H.E.C.

(1 and 2.) We think you are almost bound to experience this lack of acceleration when using a paraffin mixture, as, of course, it does not evaporate so readily as pure petrol. Fitting a hot air pipe to the carburettor would undoubtedly assist matters. (3.) You would probably get better results by using Binks fuel if mixed with petrol. (4.) Yes, it will evaporate when once the engine has been started, and will evaporate at atmospheric temperature, but only very slowly. It is necessary to start on petrol. (5.) No, not without injecting petrol first.

**A FEATURE OF THE LATEST DOUGLAS.**

The new Douglas tool bags. Note their size and divisions for spares. (See description on p. 56, July 20th.)

**READERS' REPLIES.****Engine refuses to take Air.**

May I be allowed to make a suggestion to "F.Y.G.," who in your issue of July 20th refers to the refusal of his 1914 Triumph to take air? If "F.Y.G." goes to a Triumph depot, obtains a new air slide and length of Bowden cable (supplied complete for about 3s. ready for fitting), and fits same in his carburettor, I think he will find a cure for his trouble. It did in my case, when symptoms were identical. —JOHN MELVILLE.

**Preventing Belt Slip.**

With regard to "C.A.C.S.'s" query in *The Motor Cycle* of July 13th, I think he can overcome his trouble to a great extent by treating his belt with a preparation obtainable from the Increased Power Co., Queen Street, E.C. This somewhat messy preparation is very slightly smeared on the sides of the belt which come in contact with the pulley flanges, and in my case I have found it invariably prevents slipping even in heavy rain. Usual disclaimer. —L. SQUIRE.

**Oiling an A.J.S.**

I have driven a 5-6 h.p. 1914 A.J.S. combination for two years for trade work, and after trouble with the oiling (the only trouble I have had on a splendid machine) I find the following the right method: Open Best and Lloyd so oil can run in a stream, give two full pumps, and then no more for eight or nine miles; never give less than two at a time, and even three pumps will not matter. I have never had a sooted plug, and the same two plugs have been in the machine since I bought it. Re clutch slip, place the front wheel against wall, start engine, lift clutch, and put in bottom gear, drop clutch very gently,

**SPECIAL NOTICE.****"THE MOTOR CYCLE" FOR NEUTRAL COUNTRIES.**

Under the existing regulations, copies of newspapers may now only be sent to neutral countries in Europe, America, and Africa if posted direct from the office of the publishers or by newagents who have obtained permission from the War Office for the purpose.

The publishers of *The Motor Cycle* have obtained the necessary permission, and, consequently, can post copies for subscribers as usual. The subscription rates to all neutral countries are 10/10 per annum; six months, 5/5.

THE PUBLISHERS,  
"The Motor Cycle," 20, Tudor St., London, E.C.

and engine should stop. Magneto is timed rather far advanced on my machine, and will pull better on hills if retarded about one-third. —WILLIAM F. HEWETT.

**EXPERIENCES WANTED.**

A.D.R. (Palling, Norfolk).—4½ h.p. single-cylinder O.K.-Precision sidecar combination, 1913 model. Speed, consumption, etc.

**RECOMMENDED ROUTES.****LEICESTER TO BLACKPOOL.—B.C.**

Leicester, Loughborough, Derby, Ashbourne, Leek, Congleton, Holmes Chapel, Northwich, Warrington, Wigan, Preston, Lytham, Blackpool.

**LOUGHBOROUGH TO RHYL.—W.A.H.**

Loughborough, Castle Donington, Derby, Uttoxeter, Stone, Woore, Nantwich, Tarporley, Chester, Queensferry, Flint, Holywell, Rhyl.

**Every  
Motor Cyclist  
should draw upon  
this Storehouse  
of Motor Cycle  
Knowledge.**

“Hints and Tips for Motor Cyclists” contains what may be termed the cream of all motor cycling knowledge up to date.

The book gives hundreds of useful “wrinkles” and little items of information concerning the running, management, and repairs of motor cycles, culled from the experience of many years of riding, and covering every detail of the machine.

The arrangement is simple and straightforward and reference is simplified by an extensive index and marginal subtitles on every page.

*Invaluable to  
the new rider.*

The  
**Fifth  
Edition**

Revised, Enlarged, and  
brought up to date.

**Contains over  
400 separate  
paragraphs.**

No matter what type of machine is used, this little book will be found of the greatest service to every rider.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if we not return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

**1915 6 h.p. New Hudson Combination**, in excellent order, very little used.—Turpins, 22-29, Preston Rd., Brighton. [0716]

**PETROL**, 6 galls., given with 1913 New Hudson, 4 h.p., 3-speed; 25 gns.—Troward, 78, High St., Hampstead. Phone: 5392. [9146]

**NEW Hudson**, 2½ h.p., 1915 Model de Luxe, excellent order, heavy Dunlops, in new condition, fine climber, and very flexible; £26.—Rev. Philpott, Arbury Rd., Nuneaton. [X4977]

**1916 New Hudson 6 h.p. 3-speed Combination**, £92/10; model D 2-stroke, 40 gns.; model C 2-stroke, £38; actually in stock.—Exeter Motor Cycle and Light Car Co., Ltd., 7, Bath Rd., Exeter. [9166]

**1913-14 New Hudson**, 3-speed, single-cyl., luxurious sidecar, all perfect, full equipment; price £40; seen tried appointment.—Bosquet, Camden Metal Works, Georgiana St., Camden Town. [9084]

**1913 New Hudson**, 3½ h.p., 3-speed, and very nice sidecar, enamelled New Hudson grey; a cheap lot at £38; all accessories; easy payments arranged.—Jones, Garage, Broadway, Muswell Hill. [9180]

**1914 3½ h.p. 3-speed New Hudson**, kick starter, clutch, chain-cum-belt drive, 26x2¼ Palmer tyres, complete with Canelet coachbuilt sidecar, enamelled to match, combination guaranteed in perfect condition; £35.—The Premier Motor Co., Aston Rd., Birmingham. [9196]

## New Imperial.

**NEW Imperial**, 2½ h.p. J.A.P., free engine, kick start; £44/8.—F. Lycett, Burslem. [X5001]

**NEW Imperial-Jap**, latest models, in stock, £38 and £44/8.—Crow Bros., Guildford. [8336]

**1916 2½ h.p. New Imperial**, 2-speed model, in stock; £38.—Alfred Procter, Chestow. [X4982]

**COLMORE Depots**, Manchester and Leicester, for immediate delivery of New Imperial motor cycles. [0805]

**NEW Imperial-Jap**, late 1915, 2-speed, nearly new, splendid condition; £25.—11, King's Rd., Brighton. [8972]

**NEW Imperial-Jap**, 2½ h.p., Rally touring sidecar, lamps, and horn, new July; £48.—F. Lycett, Burslem. [X5000]

**NEW Imperial**, 2-speed, new; special bargain, £36/15 cash; gradual payments 2%.—Referee Cycle Co., 332, High Holborn. [0765]

**1915 New Imperial-Jap**, 2½ h.p., 2-speed, F.E., excellent condition; £27; exchanges.—Newham, 223, Hammersmith Rd., W. [9082]

**1915 New Imperial**, 2½ h.p. J.A.P., 2-speed gear, lamp, horn, splendid running condition; sacrifice £25.—Alfred Procter, Chestow. [X4981]

**NEW Imperials**, latest models in stock; 2-speed, also kick-starter hand-controlled clutch models.—P. J. Evans, John Bright St., Birmingham. [X5030]

## MOTOR CYCLES FOR SALE.

## New Imperial.

**1916 2½ h.p. 2-speed New Imperial-Jap**, only 3 months old, runs perfectly on petrol substitute; any trial; owner buying combination; £32.—Springfield, High St., Sidcup, Kent. [9059]

**NEW Imperial-Jap**, 1916 models, delivery from stock; 2½ h.p., 2-speed, £38; 2½ h.p. ladies' model, 2-speed, clutch, and kick-starter, £46/8.—Elce and Co., 15-16, Bishopsgate Av., Camomile St., E.C. [0492]

**NEW Imperials**, the handy lightweights, with J.A.P. engine and 2-speed gear. We are the accredited agents for Manchester and Liverpool district, and can offer immediate delivery from stock; extended terms and exchanges arranged. Call or write.—Colmore Depot, 31, Renshaw St., Liverpool, and 261, Deansgate, Manchester. [0814]

## New Ryder.

**PETROL**, 6 galls., given with 1915 New Ryder-Jap, 2-speed; 24 gns.—Troward, 78, High St., Hampstead. Phone: 5392. [9144]

## Norton.

**BIG 4 Norton Combination**, S.A. countershaft; delivery from stock.—A. J. Young and Co., Ltd., Newmarket. [8633]

**NORTON T.T.** 3½ h.p., competition machine, in splendid order, and very fast, enamelled red, with gold lines; £30.—Sydney Hall, Stevenage. [X4913]

**NORTON**, late 1913, 4 h.p., coachbuilt sidecar, 3-speed, free engine, new tyres and belt; £35; perfect condition.—Ledger, Market St., Wellington, Salop. [X4992]

**PETROL**, 8 galls., given with 1915-16 Norton Big Four coach combination, Sturmer countershaft gear, perfect; 66 gns.—Troward, 78, High St., Hampstead. Phone: 5392. [9146]

## N.S.U.

**N.S.U.**, 1914, 2 h.p.; 2-speed, free, 130 to gallon, good condition; £19.—12, Oakhill Rd., Sutton. [9117]

**1914 5-6 h.p. N.S.U. Combination**, 2-speed, free engine, 20 gn. Bramble sidecar, tyres, etc., as new; exchange for A.C. Sociable of recent date.—9, Clephane Rd., Essex Rd., N. [9058]

**N.S.U.**, 1912, 3 h.p. twin, spring frame, 1915 B. and B. new adjustable pulley and saddle, Hutchinsons R.S., Douglas T.T. bars, Cowey, very good order; £10.—B. 21, Semley Rd., Norbury. After 7. [9065]

## N.U.T.

**N.U.T.** 3½ h.p. Twin, 3-speed, clutch; £32.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [9012]

## O.K.

**1916 O.K.**, Mark III, open frame, 2-speed, hand-controlled clutch, Cluchoer de Luxe tyres, in perfect order, soiled only; £36.—Robinson's Garage, Green St., Cambridge. [9154]

## Omega.

**3 h.p. 2-stroke 1914 Omega**, B. and B., Simms mag., perfect condition; bargain, £20.—6, Colly Rd., Norwood, London. [9122]

## P. and M.

**1914 3½ h.p. P. and M.**, 2-speed, wicker sidecar, in perfect condition; cash or easy terms; £45.—R. E. Jones (Garages), Ltd., Swansea. [0721]

**1912 3½ h.p. P. and M.**, 2-speed, sidecar, new cylinder, piston, and kick starter, lamp, horn, spares, just overhauled; £30.—Hawley, Oakhill Rd., Ashted, Epsom. [9111]

**P. and M.**, 1913, 3½ h.p., 2-speed gear, new coachbuilt sidecar, full outfit, in good condition; £40.—Take and Bell, Ltd., Motor Dept., Carlton Engineering Works, High Rd., Tottenham, N. [7990]

**1913 P. and M.**, countershaft 2-speed and free, Millford coachbuilt sidecar, Lucas outfits, just overhauled, excellent condition throughout; £35.—T. 92, Northcote Rd., Clapham Junction. [8951]

**1914 3½ h.p. Phelon and Moore**, 2-speed gear, kick start, chain drive, Lucas lamp set, 1 gn. horn, Cowey speedometer, excellent tyres, engine guaranteed perfect; £42/10.—Robinson's Garage, Green St., Cambridge. [9132]

**P. and M.**, 1914, condition equal to new, Coronet sidecar, coachbuilt, all accessories, 3 new spare covers, 2 spare butt-end tubes, one engine chain, 10 gallon petrol, No. 1, lamps, 2 horns, 1 valve; £58.—Pickles, 230, Queen's Rd., Haliiax. [8769]

## Peugeot.

**PEUGEOT** Twin, 3½ h.p., Bosch, B. and B., perfect condition; £10.—75, Vanner Rd., Sydenham. [9086]

## Poce.

**POPE**, 1914, 4½ h.p., C.B. sidecar, 2-speed, F.E., spares; £36; or exchange Douglas, 1914-15.—31, Ennersdale Rd., Lewisham. [9160]

## Premier.

**3½ h.p. Premier**, T.T. bars, Grade pulley, very fast; £22.—Roodhouse, Engineers, Conisborough. [X4744]

**2½ h.p. Premier**, excellent condition; bargain.—Geo. 2 F. Newcombe, 15, Ashcroft Villas, Cirencester. [9095]

**1914 3½ h.p. Premier**, 2 speeds, coachbuilt sidecar; £45; cash or easy terms.—R. E. Jones (Garages), Ltd., Swansea. [0823]

## The Effect of Cheap Fuel on Lubrication.

**B**EFORE motor cyclists adopt the cheaper white oils and paraffin-petrol mixtures as the motive power for their engines, they should consider very carefully what effect these are likely to have on the oil with which the engine is lubricated. So long as the combustion is perfect there is nothing to fear, but if paraffin in any quantity is allowed to escape unburnt past the piston rings into the crank case it is likely so to thin the lubricating oil that the latter no longer has sufficient viscosity to maintain an oil film in the bearings, with the result that, when the oil film breaks down at the moment of greatest pressure, we have metallic contact between the bearing surfaces accompanied by excessive heat and undue wear.

It is possible that this injurious effect will be less noticeable on motor cycles than in the case of car engines, for the reason that the oil is being constantly fed to a motor cycle, in the majority of cases, from a fresh supply and used up in a few miles, whereas in a car engine a sufficient supply of lubricant is carried in the sump to last 1,000 miles, and the addition of paraffin (even in small quantities) to this may very seriously interfere with its lubricating powers. As a matter of fact, the analysis of an oil so used in a light car showed quite a considerable loss in viscosity.

It therefore behoves all motor cyclists who wish to experiment with the heavier fuels not only to see that their piston rings are a good fit, but also that the vaporisation of the fuel is assisted by heat. They will then have little to fear. What we should advise motor cyclists to do is to drain the oil from their crank cases more frequently, say every 150 to 200 miles, and charge the crank case with fresh lubricant. Still another useful tip is to use slightly thicker oil, i.e., with more body in it, than in the normal course. There will then be less fear of the

oil in the chamber becoming diluted to the extent of causing damage to the bearings.

## Economy Committee at Cross Purposes.

**O**N the one hand we have the War Savings Committee urging the people of this country to economise to the utmost; on the other we have a committee placing obstacles in the way of that desirable achievement. We have in mind particularly at the moment the question of travel. The cheapest possible method of power locomotion, whether the Government Departments know it or not, is by motor bicycle. We are in the middle of summer and the holiday period, and no doubt a great many munition workers, exempted men, and people over military age, are contemplating or have made arrangements for a short respite. Deprived of a reasonable quantity of petrol they must resort to the already congested railway, and that means a bigger outlay, unnecessarily so seeing that the motor bicycle will be lying in its shed unused for lack of a tin of petrol. Some may retort that this is not the time for holidays! True, but many a toiler finds that the continuous pressure of modern times absolutely demands a rest to restore him for efficient work. Then again, many a man abandoned his holiday last year. We ask—seeing that no one has touched upon this point—if the question of "seasons" has been considered? We estimated on the official petrol cards our spring consumption. After this summer term—essentially the one in which the most petrol is used by motorists—we arrive at the autumn period, when motoring wanes, partly owing to colder days and less favourable weather. The fact remains that motorists are very much incensed at the meagre allotment at the period when money could have been saved by using one's motor—on which the tax has been paid—in preference to a railway carriage, always so stuffy and objectionable on a hot day.

BY

LION

### The Scott Three-wheeler.

This novel vehicle suggests a whole catalogue of subjects for thought and discussion, but its supreme interest consists in the fact that one of our leading engineers has at last considered the problem of a light three-wheeler *de novo*, and has found it soluble along sidecar lines. In the past the same problem has been attacked by many engineers, and has found various solutions. In earlier days the idea of detachability betrayed most engineers into the side-tracks represented by the sidecar and the tricar; and when progress piled on weight, horse-power, and general luxury, the underlying basis of the motor bicycle dominated men's minds so completely that years passed before anybody broke away from it. The tricar proved a failure; the sidecar has done well in private ownership, though its very disappointing records in long distance competitions suggest that it has only recently become a desirable machine to buy "for keeps" where hard work was in prospect. The A.C. Sociable and the Morgan runabout frankly broke away from the obsession of utilising a motor bicycle frame and make-up as the major portion of the three-wheeler, and the Morgan has a particularly good record in competition. Many thinkers have finally abandoned the three-wheeled principle in favour of the glorified quadricycle, recently yclept a cycle car, though their productions have never really established themselves on the market; and their main result up to date has been to suggest an unquestionable success in the light car, leaving the problem of a light motor cycle passenger combination still largely unsolved. At last an engineer arises who agrees with Mr. Morgan that the three-wheeler is the real solution, but differs from him profoundly as to the correct method of applying the three-wheeled principle. While the former adopts a chassis resembling in plan a steep isosceles triangle with its base in front, the latter prefers a right-angled triangle with its hypotenuse as the off side. The only serious objection to either consists in appearance. The Morgan always looks rather unsupported behind, and the Scott looks lopsided; this point may be ignored, as the sidecar is most ungainly in appearance, but has nevertheless won the public affection.

### Its Promise.

I should not devote so much space to the Scott if I did not feel that its intrinsic merits promise it at least as large a niche on our markets as the Morgan already enjoys. I have always felt that the costly sidecar outfit *de luxe*, however well designed and made, was an absurdity. Its dirtiness, inaccessibility, and discomfort arose from the folly of starting with a complete motor bicycle as the basis, and forgetting that the motor bicycle could be ignored in

all cases where detachability was no longer desired: *i.e.*, the sidecar may survive in its lighter and simpler forms, since some men will always want a passenger carrier as an afterthought or for occasional use, and that in all other cases the sidecar is an absurdity. Nevertheless, the enormous mileage annually covered by sidecars shows that the Scott arrangement of a three-wheel chassis is sound in principle and has certain practical advantages. Wherefore the ultimate evolution of such a machine as the Scott, which is the sidecar principle purged of its absurdity, is inevitable. One's sole doubt as to its being the pioneer of a type commanding huge sales is the reflection that most users would undoubtedly prefer the appearance of the Scott plus an extra wheel, and whether many users would not pay the extra cost implied by such an addition, connoting a fourth wheel, an extra axle, and a reverse gear. Anyhow, the sidecar principle, thus purged of its anomalies, is sure to be tried out, and Mr. Scott is at least the pioneer of a long series of experiments, whether or not he proves to be the founder of a permanent type. This brilliant attempt to endow the sidecar principle with permanence is the main interest of the new vehicle. Should it fail, we may expect to see the passenger market simmer down eventually with the detachable sidecar and the light car as its two extremes, the gap being filled by a fleet of variegated designs, including such compromises as the Morgan and the light quad.

### Fascinating Details.

In its dual attack on the few survivors of the four-wheeled cycle car and the sidecar *de luxe*, the Scott three-wheeler is assisted by a host of brilliant details. Being assembled from a bundle of tubes with an ease reminiscent of a Meccano model, it is cheap to construct and repair. It eliminates the need for a reverse by retaining the microscopic turning circle of a sidecar. It is far better sprung than any sidecar has ever been. Its engine is extremely accessible, and will nevertheless keep perfectly clean. The transmission may prove to be the best yet fitted to a motor cycle. Its light weight makes for speed, low fuel bill, and tyre life. It incorporates convenient and slightly accommodation for a good bulk of luggage. There is no inaccessible wheel—a merit which is novel on three-wheelers of all previous designs. The engine is a simplified form of the simplest type of engine known to us if we take it for granted that the rotary valve will give no serious trouble for a considerable mileage. The hand starter is better than any kick-starter, and far better than the usual motor car handle starter. The lubrication ("petrol") is of a type admitted to possess marked technical and practical advantages; the external dirtiness inseparable from it is of comparatively small

## Occasional Comments.—

account when the engine is encased, and does not come between the driver's calves. Decarbonisation is extraordinarily simple, as sidecarists accustomed to cleansing an 8 h.p. V twin mounted in a diamond frame will be the first to perceive. Altogether the alternative types of three-wheeler, and particularly the high-powered £120 type of sidecar, must face a very formidable rival indeed. Its main principle is singularly attractive, and the detail work, so far as it can be judged by eye or on paper, seems absolutely brilliant. At the moment of writing I have little information as to the resurrection of four-wheeled cycle cars after the war; but if a four-wheeled edition of the Scott three-wheeler could be listed at, say, £10 more than the present vehicle will cost, the most dangerous rival would be identifiable. In the meantime we do not know what the peace price of the Scott three-wheeler will be.

## Light Car Competition.

In all considerations of the future evolution of light two-passenger outfits, we have to keep a watchful eye on second-hand light cars, and especially when the question of £ s. d. is considered. The light car is in

THE NEW 5 h.p. SCOTT THREE-SPEED SHAFT-DRIVEN SOCIABLE (Described exclusively in "The Motor Cycle" of July 27th and August 3rd).

Shows the complete protection for driver and passenger provided.

its infancy, and its 1913 editions were admittedly poor stuff as compared with the 1915-1916 types. Yet these 1913 models are daily fetching upwards of £130, which is a lot of money for the class of buyer who merely seeks the cheapest satisfactory transport for two people. Moreover, the supply of second-hand light cars is still remarkably small, as the 1913 output was very limited; and the prices have been

raised at least 40% by the practical cessation of manufacture since August, 1914. In other words, within two years of the declaration of peace, there should be an almost unlimited supply of second-hand light cars available at about £100 apiece. Such a car as a 1913 Morris-Oxford, Singer, or other leading make, would be uncommonly good value at £100 to-day; and the £100 bargain of, say, 1919, will represent a little-worn 1916 Calcott (to name one make). Such alternatives will knock the £120 sidecar outfit clean off the market, one would think; will very seriously interfere with the production of cheap quads; and will limit the chances of such new introductions as the Scott three-wheeler, and render its retail price one of the main factors, if not *the* main factor, in its commercial success. One might confidently predict an enormous vogue for such a vehicle at, say, £75; but with every £5 advance towards £100 its chances of big sales would dwindle appreciably; and at £100 its market might even approach the problematical. For we must remember in all speculations and prophecies that the days will come when cars will be no longer sold, as bicycles once were sold too, for one, two, or three years' use, but for five, ten, or even fifteen years' work; and the history of the bicycle shows that the durability factor of mechanical transport machines lengthens out fairly rapidly, as design settles down. First cost will very soon be the dominant factor in the success or failure of the lighter two-passenger outfits; and uncertainty as to the future in this respect has deterred many big con-

Entrance from driver's side, a very desirable arrangement not found on many cars of much greater price and power. Observe tilting steering wheel.

Engine exposed, showing extreme accessibility. The front mudguard forms the petrol tank.

cerns from dabbling with light three and four-wheelers, especially since the light car made good. Indeed, this truth forms the sole justification of those makers who continue to embody high-powered twin bicycles as the groundwork of costly passenger outfits; they have proved to be good temporary compromises; and innovations were certainly rather risky.

## An Aeroplane Type Sidecar Body.

A sporting sidecar attached to a 1913 model Rudge. The rear suspension is a novelty, being composed of elastic bands on the lines of an aeroplane's landing chassis.

THE smart-looking sidecar body herewith illustrated has been built to the design of a naval officer by a well-known firm of aeronautical engineers. It is constructed of a mahogany and ash framework covered with aluminium sheet. In order to combine extreme lightness with strength no door has been fitted; this also, of course, prevents the clean

lines being broken. It will be seen that the body closely resembles the fusilage of an aeroplane. The method of springing the rear of the body is decidedly novel, elastic bands being used in a somewhat similar manner to that in the shock-absorbing device on an aeroplane's landing wheels. We understand that this method of springing is perfectly comfort-

able, while the system is very worthy, owing to its simplicity and lightness. We are told that the body is only three pounds heavier than the old cane body which this one replaces.

The owner speaks in very high terms of his Rudge, which, although only a 1913 model, is capable of pulling a sidecar well.

## Improved Mudguarding.

THE middle of summer may not seem the most appropriate time for referring to the mudguarding of motor cycles, but the great room for improvement in this respect is sufficient excuse, if any be needed, for so doing.

The auxiliary leather guards illustrated herewith are not new, sketches of this particular type having been published in *The Motor Cycle* of December 23rd last.

They are so practical, however, that the photographs showing them actually fitted to a Sunbeam will be of general interest. The inventor is Mr. J. A. Macgill, of Bangkok, Siam.

The guards consist of a couple of strips of varnished leather attached beneath the footboards, carried over a crossbar situated some six inches above the front of the footboards, and then

carried back and attached to another tubular crossbar situated in any convenient position on the top tube, preferably as near the rider's legs as possible. In conjunction with a good front guard, these strips afford excellent protection from mud, rain, and cold.

Mr. Macgill tells us that he has had the top crossbar nickel plated, which improves the appearance.

J. A. Macgill's auxiliary leather guards fitted to a 3½ h.p. Sunbeam.

## STEERING HEAD DESIGN.

### A POINT WHERE IMPROVEMENT IS OVERDUE.

**A**N interesting point was raised in *The Motor Cycle* by a correspondent in France in connection with steering head troubles, and it certainly is extraordinary that it has taken the test of war to bring this point into prominence, for it certainly is no new one. One piece of advice which is often given to prospective purchasers of second-hand machines is "to see that there is no shake or looseness in the head," but in view of the fact that few machines on the road can hold the steering head adjustment for more than about 500 miles, the advice is more or less superfluous. Under ordinary conditions, no doubt no serious trouble results, beyond the slightly increased tendency to sideslip which slackness anywhere in a frame produces, but to the mechanically-minded rider the disadvantages of a sloppy steering head are sufficient to make it a source of chronic worry.

There are several causes which combine to produce the trouble in question, most of which could be easily removed, as usually happens in such cases, if the matter were investigated. Most motor cyclists are familiar with the usual steering head construction, which is one of the few legacies of the push bicycle, now that pedals and the free wheel are happily things of the past.

#### Pressing in the Ball Races.

The head itself, shown in section in the diagram, usually a steel pressing or a malleable casting, is recessed top and bottom, and into this recess the grooved steel races are pressed. Now herein lies one of the difficulties, for in order that the load shall be equally distributed over all the balls, and not concentrated on a few, it is essential that the working faces of the two ball races should be truly parallel. Several possibilities of error arise: first the working surface or plane of contact of the balls may not be parallel with the face C of the ball races, the races themselves may not bed properly in the recess owing to a careless workmen allowing dirt or scale to remain in the recess, or not pressing them in squarely, and lastly the face D of the recess may itself be out of parallelism with the corresponding face of the upper race—an error that is exceedingly likely to arise even if truly square when machined on account of the distortion produced in brazing. If any of these errors arise a serious overloading of certain of the balls will take place, with a consequent rapid wear of both balls and races.

#### The Difficulties of Adjustment.

Another fruitful cause of trouble is the fact that the working face of the adjusting nut is almost certain to be out of square with the axis of the head, a point generally recognised in the design of ball thrust bearings; the consequence is that the top half of the upper ball race lines itself up with this untrue surface,

and thus throws the load to one side of the bearing, with the evil results already mentioned.

The next point in order of demerit is the adjustment, an operation calling for a great deal more skill and pains than it usually receives, especially in view of the fact that a ball thrust bearing may easily be given an initial axial load of as much as a ton by unskilful adjustment, and still work easily enough to escape notice. How often does one see amateurs—yes, and often mechanics who ought to know better—adjusting the head with the front wheel on the ground, and as long as the handle-bars turn fairly freely and there is no shake, the head is considered correctly adjusted. Obviously, it is impossible to tell by this method whether an initial and unnecessary load is not being applied to the bearing. Instead, the front of the machine should be supported, and preferably the front wheel removed, so as to make the "feel" of the bearing as sensitive as possible; but this is a refinement which is often rendered unnecessary by the shocking existing condition of the balls and races.

#### Larger Bearings Necessary.

To effect some improvement in this matter is not difficult when one considers in how many directions it may be attempted. In the first place, the size of the present bearings in nearly every case is hopelessly inadequate, and even at the expense of an unusually large head they ought to be increased both as regards diameter and size of balls. The adjusting arrangement is another point which requires considerable modification to ensure alignment, and, if at all possible, the length of head should be increased to reduce the journal loads which this long-suffering bearing has also to carry. A good lubricator, too, should be fitted.

#### Plain Bearings not a Remedy.

As regards the suggested solution of the difficulty by the use of plain bearings, there is not much hope in that direction. Plain bearings are neither necessary nor desirable, as readers of *The Motor Cycle* who remember the old plain bearing bicycle will know, for a dismount had to be made every ten miles or so for the purpose of oiling the wheel bearings. This, by the way, is the origin of the custom, still in vogue with the fair sex, of carrying an oilcan in the tool bag, to the great detriment of the appearance of the inside of the bag and the condition of one's fingers after opening it. At least I have never been able to obtain an explanation from any lady as to why she carries a messy piece of goods like the average cycle oilcan, which she never by any chance uses on the road; so I take it that, like other inherited and undesirable instincts, it is a vestigiary trace of the plain bearing bicycle.

ANTIDOTE.

# ECONOMICAL TRAVELLING.

FIVE HUNDRED AND TWENTY MILES ON FOUR GALLONS OF PETROL.

**F**INDING that I had the inside of a week at my disposal, and having need to visit a relative in Cornwall, from motives of economy I decided to make the trip by motor cycle. I spent no time in tuning up my 3 h.p. Enfield or other preparations, took no spares, but a couple of sparking plugs, and left my home in the Midlands at about noon, intending to ride just so far as I felt inclined on that day, and to finish the journey on the next.

## The First Gallon.

My way lay *via* the Fosse Way, which south of Halford is rather narrow and with the surface of an ordinary country lane, rather rough, but far preferable to the pot-hole roads one often meets with on many main thoroughfares. I lunched at a wayside inn, not far from Fosse Bridge, where there is a steep drop and rise, sitting on a stone bench by the roadside, having so far covered about fifty miles.

The road was now wider and better. Cirencester was soon left behind, but when I had left the Tetbury Road and was nearing Malmesbury an ominous bump showed that the rear tyre was flat. This short account is not intended to be a record of tyre trouble, therefore it will suffice to say that my luck in tyres was out, and I had to remove the back cover no less than seven times. On the other hand, I had no involuntary stops except those in connection with tyres.

Newbury Headland

ALTERNATIVE ROUTES FROM THE MIDLANDS TO NEWQUAY  
(FOLLOWED BY THE WRITER OF THE ACCOMPANYING ARTICLE).

With occasional delays I passed through Chippenham, Melksham, Frome, Trowbridge, and Bruton. It was now beginning to get dusk, and I commenced to look out for a suitable stopping place. The inn at the pretty village of Sparkford was full, so I journeyed on to Ilchester, where I found comfortable quarters.

A run of about a dozen miles on the following morning, during which I passed by an ancient camp to the south of the road, brought me to Ilminster, where I took in a gallon of petrol.

## The Second Gallon.

At Ilminster I was advised to avoid Chard and take the direct road to Honiton. This I did, and found the road hilly, but not at all bad. From Honiton to Exeter the road was in excellent condition, and I enjoyed a capital run at a fairly fast pace. Exeter streets were pot-hole and bad—the worst roads I encountered during the trip—and I was glad to leave the city behind, but so long as I followed the Okehampton Road I found the surface bumpy. However, after about a couple of miles, I bore to the left and made for Moretonhampstead and Dartmoor. The road now ran through lovely scenery, but was very hilly—in some places it was

Glastonbury

well engineered, and wound in and out through the trees as it climbed the wooded slopes above the valleys; in others it seemed

to take a delight in ascending the steepest places. Far-rant's Hill, for example, being like the roof of a house, apex and all; when a *détour* of a

mile or so would have taken one round by the River Teign, here little more than a brook. Then followed the long rise (three miles) of Doccombe, where the road curls till it seems to be climbing in a spiral. Within a few miles I reached the wilds of Dartmoor itself; the climbs gave me no trouble, and I was able to run down the hills, which for the most part are straight, at about 35 m.p.h. with the engine at rest. The roads, which are sometimes rough, were in very good condition, and the day was glorious.

The ascent from Two Bridges past Princetown

**Economical Travelling.—**

was followed by two long descents; the first to Merivale Bridge is suitable for fast travelling until near the bottom, where there is a right-angled turn to the right, followed by a bend to the left just before reaching the bridge. Here I saw about 100 Dartmoor ponies of all ages and some twenty men looking over them. The next hill, Moorshop, is winding and needs care. Passing through Tavistock and over country which was still hilly, I soon crossed the Tamar into Cornwall, and was immediately faced with the stiffest climb I had encountered on the trip—the ascent through Gunnislake village. This was made rather rough by traction engine traffic. The road rises about 600 feet in  $1\frac{1}{2}$  miles. The view looking back towards Devon was magnificent, and reminded me of the cliffs above the Wye at Simonds Yat, with huge rocks standing boldly out amongst the trees.

My way now lay through Callington, Liskeard, down the lovely Glynn Valley, through Bodmin, and over Goss Moor, where there is about three miles of almost dead straight open road on a slightly falling gradient—a very fast stretch—to Indian Queen. Here I turned to the right through the twisty Colon lanes to Newquay—my destination.

**The Third Gallon.**

After a couple of days spent by the sea, I left for home on a drizzly morning, taking the coast road through St. Columb, Wadebridge, and Camelford, as the rain seemed likely to be worse inland. And so it proved, for when I turned away from the coast at the last place and crossed the moors to Launceston, it became much heavier, and I was glad to take

shelter and lunch at Lifton. The weather then improved, but, after skirting Dartmoor to Okehampton, I ran into another storm; however, the delay was not for long. Wishing to avoid Exeter, I made for Bow, but soon lost my way in the country lanes. Fortunately, a pretty girl in a car came to my assistance. At Crediton I turned to the left, taking the direct but hilly road to Tiverton.

The rest of the day's trip through Taunton to Glastonbury, where I stayed the night, was uneventful.

**The Fourth Gallon.**

The next morning broke fine, but I did not make a very early start, owing to tyre repairs. Wells was soon passed. Then came a long climb over the Mendips and an undulating road to Bath. After turning off the London Road there is a two-mile ascent on to the Cotswolds, where there is a fine open run skirting some lovely parks, but passing through few villages, till one drops down into Nailsworth and Stroud. The road from Stroud to Cheltenham is very attractive, especially from Painswick to the foot of Birdlip.

There are tramlines all the way from Cheltenham, through Prestbury, to the top of Cleeve Hill, but, after being accustomed to seeing trams always taking the best parts of the road, it was pleasant to see them running unostentatiously in the ditch, and leaving the road almost unobstructed. At Broadway both tyre troubles and rain began, and my trip for the last forty miles was anything but pleasant.

In conclusion, I must pay a tribute to my machine,

**MOTOR CYCLES IN THE SERVICE OF FIRE BRIGADES.**

In America part of the equipment of all modern fire stations is a small fleet of motor cycles, which are very useful for clearing the way for the big motor engines and taking express messages, etc. These photographs show a typical Harley-Davidson fire machine, and it will be noted that four small extinguishers are carried on the carrier.

which ran excellently throughout, and climbed every hill on the route. The petrol consumption was very satisfactory. I had a small quantity in the tank before putting in a gallon at the start. The total distance of the trip was 520 miles, and I rode a further twenty miles before the last gallon was exhausted. The cost of this journey by rail would have been about 50s., and had I gone by train I should not have been able to pay a visit off the main route without further expense in carriage hire. The oil consumption amounted to about half a gallon.

So much for the economy of the motor cycle, even with petrol at its present price!

AURIGA.

## "Motor Cycles and How to Manage Them."

Some Notes on the 17th Edition of the oldest Handbook dealing with the Pastime.

THE seventeenth edition of "Motor Cycles and How to Manage Them" has just made its appearance on the bookstalls throughout the country. At first thought the present may not be considered an altogether opportune moment for bringing out a revised edition of such a book, however popular it may be. As a matter of fact, the demand for a handbook describing in simple language the principles of operation and the care and upkeep of motor cycles of all types has grown as a result of the war, the reason partly being the great expansion of the different military sections in which motor cycles are used. Many riders, with very slight technical knowledge, have joined motor sections, and they have found "Motor Cycles and How to Manage Them" of great use in "polishing up" their knowledge, and so making themselves more efficient soldiers. Then, again, the number of ladies and men above military age who have become motor cyclists continues to increase at a steady rate, and for all these a book such as the one under review is a *sine quâ non*. Hence for these reasons it has given us

opinions expressed therein are not merely one man's point of view, but a condensed composition of all the most useful and instructive features gleaned from all sources, and some of which have appeared from time to time in *The Motor Cycle*.

The revised edition contains a complete and comprehensive list of illustrations, there being no fewer than four hundred. The complete manner in which the book deals with each unit from the bicycle to the engine, gear

Fig. 42.—Sectional drawing of the three-speed Lea-Francis countershaft gear. (A typical illustration from "Motor Cycles and How to Manage Them," 17th edition.)

Fig. 32.—Interior mechanism of a simple two-speed gear box of the Douglas type. (A typical illustration from "Motor Cycles and How to Manage Them," 17th edition.)

pleasure in revising, under difficult conditions, the last edition of "Motor Cycles and How to Manage Them."

There are always newcomers to the ranks of motor cyclists, and it is undoubtedly to the interest of all novices to know as much as possible about the construction and the faults from which their machines may suffer, for, even though they may not be inclined to do their own repairs, it is as well to know what is wrong and what may be necessary to do to make the repair. Knowledge of the mechanism has always been both useful and interesting, but never before has it been so essential for the novice to have some knowledge of his mount as it is to-day, with garages depleted of men and the manufacturers' works engaged on munitions, so that private repairs are delayed, if carried out at all. It will, therefore, interest the many newcomers to the ranks of motor cyclists to know that the latest edition of "Motor Cycles and How to Manage Them" is now on sale. This handbook, which is the oldest manual dealing with the pastime of motor cycling, has been compiled and revised from time to time entirely by practical motor cyclists, and the views and

two-stroke lightweight necessary to give this type of engine more prominence than in previous editions, and a special section is devoted to the principle of working of the different types of two-stroke engines, and many useful tips on rectifying faults peculiar to this type are given.

The more experienced motor cyclist will find much to interest him; for instance, the chapter on the balancing of motor cycle engines, illustrated descriptions of different makes of machines and accessories,

cubic capacity table, speed tables, and much other most useful information.

### Change Speed Gears.

The mechanism of change-speed gears is a subject which puzzles a good many practical motor cyclists; the various types of change-speed gear have, therefore, received very special attention, and, with the aid of sectional drawings and diagrams, every rider who takes an interest in the mechanical features of his machine should be able to follow the working of any change-speed gear fitted to a motor cycle.

The lady motor cyclist has been carefully catered for, and a special chapter written by a lady motor cyclist deals with feminine requirements. In fact, "Motor Cycles and How to Manage Them," complete as it was in previous editions, now contains all the information any motor cyclist is likely to require from A to Z.

## PARCEL CAR BODIES

As shown in illustration, suitable for almost any sidecar chassis.

### DESCRIPTION.

The INDIAN PARCEL CAR is most substantially made with Ash ribs and 6 mm. 3-ply board. It is divided into two separate compartments, the front accessible through a hinged top with two spring locks, and the rear compartment by means of a door opening outwards, which is provided with a lock and key. The overall dimensions of the PARCEL CAR box are 48in. long, 19in. wide, and 24in. deep. Enamelled Indian red, nickel fittings.

**PRICE, BODY ONLY, £3 F.O.B. London.**

*In answering this advertisement it is desirable to mention "The Motor Cycle."*

**Hendee Manufacturing Co.**

## DRIVING A SIDECAR ON PARAFFIN

A Test of the  
QUADRANT  
PARAFFIN  
VAPORISER  
using "Lamp  
Oil" at 1s. per  
gallon.

Filling up with paraffin at a shilling per gallon. Mr. T. Silver, designer of the vaporiser fitted to the Quadrant, on the right.

OUR brief trial of the post-war  $3\frac{1}{2}$  h.p. Quadrant described in our issue for August 3rd induced us to arrange for a more exhaustive test with the paraffin vaporiser.

Mr. Tom Silver accordingly placed the machine and sidecar at our disposal, with the auxiliary tank filled with petrol. The main tank was empty—in fact, bone dry—and, driving on the lighter fuel, we repaired to an oil shop to fill up with paraffin.

The  $85 \times 88$  mm. engine started at the first kick down of the starter pedal, and we moved off, with Mr. Silver driving, so smoothly and quietly that our first impression of the  $3\frac{1}{2}$  h.p. Quadrant was its silent running.

After a few minutes' running we turned off the petrol and opened the paraffin tap. The air lever had been fully open, and, without changing the positions of either the air or the throttle, we continued our way without noticing any difference in the running. The vaporiser was now warm, but it was still possible to bear the hand upon it.

After several miles had been covered the vaporiser was much warmer; but the running was not materially affected, which rather proved that a very high temperature was not so necessary as might be considered, although the higher temperatures probably would have a beneficial effect upon the engine lubrication, for incompletely vaporised fuel would tend to wash the film of oil from the cylinder walls. On this point it is interesting to note that a more frequent use of the oil pump did not appear to be necessary when paraffin was used.

### Fixed Magneto Timing.

We now called a halt to take the driver's saddle, while Mr. Silver became the passenger. On looking round the controls we noticed the absence of a magneto lever, and were informed that this had been taken off in order that the conditions should be exactly the same for both petrol and paraffin. The timing of the ignition was the Quadrant standard practice, i.e.,  $\frac{3}{16}$ th before the top of the stroke.

The vaporiser by now was almost cool, and, with the air lever fully open and

the throttle about a third open, we continued the run. We found no difference in the driving, and only succeeded in creating a knock under conditions which would have produced similar results with petrol.

### A Light Sidecar.

The first impression in the saddle was one of extreme lightness—in fact, it reminded us very much of the sidecarrette, and enquiry revealed the fact that, despite the coachbuilt sidecar, the weight complete was only 296 lb. We had driven another  $3\frac{1}{2}$  h.p. sidecar the day before, and this weighed 386 lb., hence the light weight of the Quadrant was a decided change.

A drove of cattle emerging from a side road necessitated a quick pull up. However, we were able to pick up speed again without resorting to a lower gear, but for the first time we noticed a difference with paraffin, as it was not possible to accelerate so quickly.

Our objective had been a hill of about 1 in 8 gradient, which we knew sufficiently well to form a comparative test. This hill usually compels the  $3\frac{1}{2}$  h.p. sidecar owner to change down, and we know the exact spots where we have changed down on similar machines and also the speeds at which it has been surmounted. There is a narrow bridge at the foot of the hill which precludes high speeds, and, all things considered, the hill provides a good test for our purpose. We halted about half a mile from the hill in order to verify the pipe connections. We disconnected the unions to make sure that when the petrol tap was turned off

there was no possibility of the spirit percolating through to the carburetter, and, after feeling the vaporiser and cylinder for comparison on a later test with petrol, we resumed the journey, and the hill was climbed with ease and good speed. Turning at the top of the hill, we traced our way to our previous halting place, and, after waiting until the cylinder was approximately the same temperature as when starting on the paraffin test, we re-climbed the hill with petrol, but with no other apparent advantage than a slightly higher speed.

### Starting after a Stop.

Changing over to paraffin again, we journeyed on. To turn the taps is quite a simple matter while under weigh. A further few miles, and we called a halt for tea. When we came to start up again the vaporiser was almost cold, and we realised that we had omitted to change over to petrol before stopping; hence the carburetter was full of paraffin. Should we disconnect the union and drain the float chamber, or try just a priming of petrol? Although anticipating failure, we tried the latter. Even Mr. Silver was doubtful, but the engine fired and continued to fire.

We were very favourably impressed by the Quadrant vaporiser, and, for the summer months at least, the device seems to solve the present fuel problem. From our test there does not appear to be any of the usual disadvantages connected with the use of paraffin. There is no black smoke from the exhaust, nor acrid fumes. Overheating does not take place, neither does the plug soot up, as is sometimes the case when heavy fuels are used. Maximum speeds are not so good as with petrol, probably due to the fact that it is impossible to open the throttle fully for want of more air than the petrol carburetter will give, therefore it would appear that an extra air inlet in the induction pipe, such as is used on cars, might increase the range of throttle supply.

Mr. Silver hopes shortly to be in a position to deliver the fitment complete with auxiliary tank at an approximate price of 25s. In ordering it is only necessary to state the make of engine and size of induction pipe, but it would probably assist if the induction pipe were sent. The fitment will form part of the standard specification on all post-war Quadrants.

The new Quadrant passenger machine on which the paraffin test was made. A light coachbuilt sidecar was fitted, the complete weight being 296 lb.

## MILITARY AND NAVAL NOTES.

## A GLIMPSE AT THE M.M.G.S.

GUNNER J. MARSDEN, of the M.M.G.S., in an interesting letter from the Front, tells us that the Clynos and Triumphs stand a really extraordinary amount of knocking about, the roads being bad enough to ruin the heaviest tractors. He also says that the M.M.G.S. are doing fine work in France, for they can move about so quickly. When the men go into the trenches for a few days the cycles are left behind and they go in cars, but in general, when moving from place to place, the sidecar outfits are employed.

## THE RANK OF D.R.'s.

A DESPATCH rider (R.E.) has written to ask whether he has the same rank as the regimental N.C.O.'s. He says that the D.R.'s are given punishments which would on no account be given to the regimental N.C.O.'s, but that, at other times, they are reprimanded for not acting as such.

## STOLEN MACHINE RECOVERED.

WE hear from L.-Cpl. Godsell, who is with the 11th Light Armoured Motor Battery in Egypt, that he has recovered his stolen motor cycle after six months. This was the result of a notice in *The Motor Cycle*. He tells us that his battery is using Douglas and Triumph motor cycles. The latter especially are doing very well out there in spite of the sand, through which they pull in a most excellent manner.

## A LUCKY SPARE.

CPL. M. TANNER, a despatch rider attached to the R.E. Signal Service, who rides a three-speed Triumph, writes as follows:

"It may perhaps interest you to know how a Clyno outfit offered me great assistance in a tight corner out here some little time ago. I am on special duty that takes me nearer to the line than is generally allowed, and naturally at times it is warmer than desired. It was on one of these occasions that I had the misfortune to break my exhaust valve. After a series of sprints and 'taking covers,' I came across a gunner with a Clyno from which I 'bagged' a valve which fitted O.K. with about 1/2 in. clearance after tappet adjustment, but nevertheless carried me back to semi-civilisation, where I was able to get a Triumph valve."

## MOTOR CYCLING IN GREECE.

A DESPATCH rider whose regiment has spent seven months in Egypt, three in Gallipoli, and six in Greece, considers that road conditions around Salonika are worse than anywhere else. The so-called roads are rough in the extreme, and the motor cyclists have to cross mountain ranges and wade through many rivers. The rider in question, Cpl. H. Russell, concludes with a word of praise for his Triumph and the Sturmey-Archer gear. The only improvement he suggests is a little more ground clearance.

## ANOTHER MOTOR CYCLIST AIRMAN.

WHILST in Wolverhampton recently we met H. R. Davies, the well-known Sunbeam rider, who tied for second place with O. C. Godfrey in the last Senior T.T. Race.

A short time ago he transferred from the R.E.'s, in which he had a commission for some considerable time, to the R.F.C. He now has his ticket, which he obtained after only a little over two hours' flying on a dual-controlled machine.

## A FINE PERFORMANCE.

MR. TUDOR-HART, who is partner with Mr. Robertson Brown in Robertson Motors, Ltd., is, we regret to say, reported as missing. After joining the Inns of Court O.T.C., he was gazetted Second-Lieutenant in the Northumberland Fusiliers, and at the end of last year was transferred to the Royal Flying Corps. He was one of the heroes of a thrilling fight in the air on June 25th, which called forth the following words of praise from the G.O.C. of the 4th Brigade R.F.C.: "The Army Commander wishes to convey to Capt. W. A. Summers and Lt. W. O. T. Tudor-Hart his appreciation of their bold and plucky performance, which reflects great credit on the pilot and observer."

F. C. Dee, who is quite an old-time motor cyclist and a member of the M.C.C., is now a lieutenant in the A.S.C., and has lately been posted O.C. to an H.A.M.T. Section.

DESPATCH RIDERS OF THE  
67TH DIV. SIG. COY., R.E.

(Top row) Reading left to right : Sgt. H. Leadley, Art.-Cpl. S. Adams, Cpls. F. E. Winter, S. S. Spencer, W. F. J. Harvey, A. Upperton, A. T. Reeve, G. Birkett, and H. F. Tomlin.

# "THE MOTOR CYCLE" RECRUITING SECTION.

Last Week's Recruits.

Further Inspections Arranged.

INSPECTIONS of recruits for the Motor Machine Gun Service were held at the Coventry Recruiting Office on Tuesday, and at the Recruiting Office, Stanford Street, Nottingham, on Wednesday last. The names of those motor cyclists and car drivers accepted will be found in the list given below.

Aspin, J. W., Ossett.  
Bond, G. S., Taunton.  
Bursall, W., Beverley.  
Chapman, E. B., Gloucester.  
Collier, H. W., Gloucester.  
Comery, H., Long Eaton.  
Dennis, F., Cleethorpes.  
Dunstan, G. C., Nottingham.  
Garrett, H., Harrogate.  
Gibbons, K. M., Stoke-on-Trent.  
Gillett, E. T., Ealing.  
Hillas, H., Bradford.  
Johnson, G. B., North Shields.  
King, G. H., Coventry.  
Massey, W. J., Kirton Lindsey.  
Nixon, W., Nottingham.  
Penn, E., Coventry.  
Pikett, G. A., Mansfield.  
Reeve, C. V., Norwich.  
Ridgway, H., Birmingham.  
Seaman, H. G., Norwich.  
Seddon, R. E., Acton.  
Smith, W., Coventry.  
Wilden, R. J., Northamoor.  
Young, A., Warwick.

## Central Office for Motor Machine Gun

### Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Appointments with another group of candidates had been arranged for Tuesday this week at the Coventry Recruiting Office, whilst on Saturday next Mr. Geoffrey Smith will be in London, and on Tuesday in Coventry, in order to examine and accept suitable recruits.

Full particulars of enlistment and a form for filling in purposes may be obtained on application, whilst the conditions of enlistment are mentioned on this page. Those prospective recruits conforming to requirements, and who are ready to join up at once, may attend any of the inspections outlined on this page. The two next dates arranged are:

LONDON.—The Motor Cycle Offices, 20, Tudor Street, E.C., Saturday, August 12th, 2.30 p.m. to 4 p.m.

COVENTRY.—The Recruiting Office, Little Park Street, Tuesday, August 15th, 2.30 to 4 p.m.

A free railway warrant will be issued to prospective recruits living at a distance, if the applicant will previously get examined before the Medical Board for his district.

The amended conditions of enlistment in the Motor Machine Gun Service are given hereunder:

EXPERIENCE.—At least one year's motor cycle or car driving experience.

AGE.—18 to 40.

ENLISTMENT.—For duration of the war.

MEDICALLY FIT.—For general service or for garrison duty abroad.

PAY.—1s. 2½d. per day, all found; the usual separation or dependants' allowance.

## PETROL IN THE HOUSE.

Hopes of the Future.

The Use of Substitutes.

THE petrol supply problem was thoroughly "aired" in the House of Commons on Tuesday of last week, and, though many of our readers doubtless read in the daily press the important speech on the subject made by Mr. Lewis Harcourt (First Commissioner of Works), the subject is of such interest to all our readers as to warrant the main facts made public being placed before them.

The debate was opened by Sir F. Banbury, who criticised the Petrol Control Committee for its lack of discrimination in dealing with claims. Mr. Harcourt then made an official statement on behalf of the Committee, and in the course of his speech the following figures were revealed:

Licences applied for .. .. .	324,000
Private car licences .. .. .	110,000
Demand by civilians (private and commercial) .. .. .	153,000,000 gals.
Available per annum .. .. .	70,000,000 "
Licences issued for .. .. .	75,000,000 "
Available per month for private cars .. .. .	700,000 "
Ditto motor cycles .. .. .	181,250 "

What every motor cyclist would like to know, of course, is what will be the position at the end of three months—will the amount be increased or decreased? On this point Mr. Harcourt could make no promise, merely stating that he hoped that the time we should have to go short might be measured by a few months.

### Not Sufficient Tankers.

The whole trouble, apparently, is due to the lack of tankers, and Mr. Harcourt stated that he hoped the Admiralty would soon be in a position to supply more of these vessels, and so release petrol tankers which are now used for the purpose of bringing the heavy oil for naval purposes. Incidentally, it was

mentioned that the unforeseen and unforeseeable rapidity of output of oil-driven battleships is closely connected with the foregoing. The question of Sunday motoring also came up, and Mr. Harcourt said that its prohibition may yet come.

The scarcity of ships to bring petrol to the country does not, however, explain the lack of discrimination displayed in dealing with claims. Mr. Harcourt said it would be impossible to make detailed enquiries in the case of 324,000 owners. Granted! But surely some discrimination could have been shown between extreme cases, such as the purely pleasure rider and the man who uses his machine solely for business, both stating frankly on their application cards the purposes for which they used their machines. According to Mr. Harcourt the Control Committee hopes to give further consideration to individual cases as time permits. In the meantime motor cyclists must be satisfied with their half-gallon of petrol per week, and avail themselves as far as possible of the use of substitutes. On this subject, however, we direct attention to a leading article in this issue, which urges that substitutes may not be adopted indiscriminately, and gives two valuable tips. We have devoted a good deal of space in *The Motor Cycle* during the past few months to experiences of our own and our readers with paraffin and other substitutes, and this week's issue contains a description of a run on a 3½ h.p. single-cylinder sidecar running on an all-paraffin mixture with most satisfactory results. The conclusion arrived at from these experiences is that all motor cyclists will find it well worth while to experiment with these cheaper fuels.

It is possible that with a wholesale adoption of paraffin mixtures a shortage of that fuel may occur, and it has been

pointed out that if the shortage of petrol is due to lack of tankers the same result will be arrived at with paraffin as soon as its consumption has risen to a certain figure. The price may rise, but it does not seem likely at the moment that there will be any immediate shortage of paraffin, though international affairs and home conditions alter so quickly that it is not safe to prophesy.

### Protesting Too Late.

Some surprise and regret has been caused among motorists and motor cyclists generally that the motoring organisations did not band themselves together for the purpose of looking after the interests of their members earlier than they did, i.e., a fortnight ago. We announced the decision reached at the first meeting, i.e., to offer the assistance of the representative bodies to the Petrol Control Committee in carrying out the new distribution scheme, in our last issue. But this was much too late, and the only hope is that they will look after the interests of motor vehicle owners by keeping closely in touch with future developments of petrol distribution and supply.

### READER'S TEST OF A PETROL SUBSTITUTE.

In these days any fuel that can take the place of petrol is eagerly sought for by motor cyclists. Our readers will, therefore, be interested to hear that we have received a letter from a correspondent who has been using Kempol with very satisfactory results. This rider first used it mixed with a small quantity (20%) of petrol and afterwards by itself. He found that no alterations were required to the carburettor—an Amac. The machine was a 6 h.p. Clyno sidecar.

## TIME TO LIGHT LAMPS

"SUMMER" TIME.

Aug. 10th	...	9.2 p.m.
" 12th	...	8.59 "
" 14th	...	8.55 "
" 16th	...	8.50 "

### Police Traps and the War.

A lady fined at Willesden for exceeding the speed limit wrote that "police traps would never win the war."

### Government Sidecars on the Wrong Side.

Sidecars are still being supplied for use in France attached to the left-hand side of the bicycle, though on the Continent the rule of the road is the opposite to ours.

### We are not Surprised!

20,000 letters are received daily by the Petrol Committee, says Mr. Lewis Harcourt. No doubt a good proportion represent appreciation by motor cyclists of the generous treatment accorded to them! Half a gallon a week in mid-summer!

### Petrol for Volunteers.

Mr. S. W. Philpott, motor cycling officer of the Liverpool Motor Volunteers, tells us that he understands that Volunteer Headquarters may be able to make arrangements with the Petrol Committee to enable motor cyclists of the National Volunteer Corps to obtain petrol at ordinary prices for necessary purposes.

### Adulterated Petrol.

A reader writes complaining in strong terms of the fact that he has purchased petrol which has obviously been adulterated. His denunciation of the petrol companies in extracting the last farthing for their spirit, and then adulterating their spirit on top of this is certainly deserved if it can be proved to be true. Has any other reader noticed any difference?

### More Petrol for Motor Cycle Road Surveyors.

Assistant county surveyors who ride motor cycles in the course of their profession will, we understand, have their claims for additional petrol considered by the Board of Trade. This will be a comfort to, amongst others, our correspondent, Mr. T. Golsworthy Crump, who uses his motor cycle for this particular work. He is one of the oldest motor cyclists in the county of Somerset, and a prominent member of the Taunton and District M.C.C., which was of great value to the A.C.U. on the occasion of the last trial held in that part of the world.

## SPECIAL FEATURES

MORE TESTS OF CHEAP FUELS. TO TEST A CARBURETTER FOR WASTAGE.  
THE 1916 A.B.C. MOTOR BICYCLE.

### The Hard Worked Petrol Committee.

It took eight days to issue a petrol licence to a member of our staff, though he posted a cheque immediately on receipt of the notification of allotment.

### Popularity of the Half-and-half Mixture.

The owner of a 2½ h.p. Popular Levis informs us that he is getting excellent results with half petrol and half paraffin. On this mixture he says the machine runs most satisfactorily, and starts without injection.

### Paraffin Fuel.

Many motor cyclists have the idea that a motor cycle will refuse to fire on paraffin unless a proper vaporiser is fitted. A motor cyclist who was compelled to make a journey of about forty miles with a 5-6 h.p. twin fitted with a Senspray carburetter was unable to obtain any petrol. He accordingly emptied the last few drops of petrol from his tank into an oilcan and filled up with a gallon of ordinary paraffin. He was astonished to find that after injecting the usual amount of petrol into the cylinders for starting the engine fired at the first kick, and continued to run perfectly. The driver assures us that had he not seen the paraffin put in, and for which he paid 1s., he would never have detected any difference in the running. The warm weather undoubtedly makes a big difference when experimenting with petrol substitutes.

### Inaccessibility.

On a new machine which has lately come into our possession the compression tap in each cylinder was loose and that in the rear cylinder was leaking badly. Imagine our horror when we found that the inlet pipe had to be detached from one cylinder and the exhaust pipe from the other before the defects could be remedied.

### National Motor Volunteers.

The motor cyclist section of the Liverpool Motor Volunteers held a parade on Wednesday evening, August 2nd, for the purpose of obtaining motor cycling recruits. About twenty N.C.O.'s and men, with two motor cycle officers, left Sefton Park end of Queen's Drive, and followed a route which practically encircles the city. At every main road or convenient spot a halt was made, and every motor cyclist passing that way was stopped and asked to join the National Motor Volunteers, all the advantages of which were also pointed out to them. They all took the stoppage in good part, though one or two appeared to think they had been stopped by the military authorities for the purpose of having their machines examined. The meeting was a success, and several fresh members obtained.

### An Economical Two-stroke.

In these days of greatly reduced petrol supplies the record of a reader who has run nearly 4,000 miles on a two-stroke Connaught is of interest. Over a distance of 3,850 miles his petrol consumption has averaged 137.5 miles—a remarkably good performance.

### Bad Feeling.

Motor cycle traders in Dodge City, Kansas, U.S.A., have received a shock in the form of an order from the municipal authorities ordering them to move their garages and repair shops from the main business district within ten days. Such high-handed action is difficult to understand. Legal authorities of the motor cycling associations are coming to the assistance of the agents concerned.

### Average Prices of Second-hand Machines.

We give below the average prices of second-hand models offered for sale in *The Motor Cycle*. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average that appeared is given, if within four weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable.
A.J.S.	1914	6 3-sp. sidecar	£75	—
"	1916	2½ 3-speed	£54	—
"	1915	6 3-sp. sidecar	—	£92
Allon	1915	2½ 2-sp., 2-stroke	£32	—
Bradbury	1913	4 3-speed	£28	—
"	1914	4 sidecar	—	£37
B.S.A.	1916	4 3-sp. sidecar	£68	—
"	1914	4 3-speed	£41	—
Calthorpe	1915	2½ 2-speed	—	£28
Clyno	1914	6 3-sp. sidecar	£50	—
Chater Lea	1914	6 sidecar	£44	—
Douglas	1915	2½ 3-speed	£42	—
"	1915	4 3-speed	£57	—
"	1914	2½ 2-speed	£37	—
"	1913	2½ 2-speed	£32	—
Enfield	1914	6 2-sp. sidecar	£57	—
"	1915	3 2-speed	—	£40
"	1914	3 2-speed	—	£31
H.-Davidson	1915	7-9 3-sp. sidecar	£63	—
Humber	1913	3½ 3-sp. sidecar	—	£35
Indian	1915	5 3-speed	£51	—
"	1916	Powerplus sidecar	£85	—
"	1914	7 3-sp. sidecar	£60	—
"	1913	7 2-sp. sidecar	£38	—
James	1915	4½ 3-sp. sidecar	—	£62
"	1914	4½ 3-sp. sidecar	£42	—
Lewis	1915	Popular	£25	—
"	1914	2-speed	—	£27
Matchless	1915	8 3-sp. sidecar	£67	—
"	1914	8 3-sp. sidecar	£50	—
New Hudson	1915	2½ 2-speed	£24	—
"	1915	4 3-sp. sidecar	—	£59
"	1913	3½ 3-sp. sidecar	£39	—
New Imperial	1915	2½ 2-speed	£26	—
P. & M.	1914	3½ 2-sp. sidecar	£48	—
"	1913	3½ 2-sp. sidecar	£35	—
Premier	1914	3½ 3-sp. sidecar	£40	—
Rex	1914	6 2-sp. sidecar	—	£51
Rover	1914	3½ T.T.	£35	—
"	1914	3½ 3-sp. sidecar	£42	—
Rudge	1914	3½ Multi sidecar	—	£39
"	1913	3½ Clutch	£28	—
Scott	1914	3½ 2-speed	—	£38
Sunbeam	1914	6 3-sp. sidecar	—	£69
"	1916	3½ 3-speed	—	£70
Triumph	1915	2½ 2-sp. 2-stroke	—	£35
"	1914	4 3-sp. sidecar	£44	—
Williamson	1914	8 2-sp. sidecar	£53	—
Zenith	1913	6 Gradua sidecar	£37	—

**Smelly Exhausts.**

During the last few days the exhaust of most motor vehicles is reminiscent of the pungent odours associated with engines of the early days. This is undoubtedly due to the fairly general use of petrol substitutes or petrol mixtures in carburettors either incorrectly adjusted or unsuited to their use.

**Petrol Requirements.**

The petrol asked for by some car drivers would keep many motor cyclists on the road for lengthy periods. For instance, Mr. H. Massac Buist refers in *The Car* to a family of two persons who have asked for 300 gallons per month. Assuming that they drive on thirty days in each month in cars capable of averaging 20 m.p.g., this means a joint distance of 200 miles a day. What their allotment was we have no means of knowing, but we hope two gallons a month.

**The Transport of Wounded.**

Sitting up cases might quite well be transported from the hospital trains to the hospitals by sidecars during the fine weather. The London Ambulance Column, which carries hundreds of thousands of patients per annum in privately owned motor vehicles, will not countenance their use. More's the pity, we think, especially as the reason is ignorance of the comfort of the sidecar. This course has been followed in Coventry. See photograph on page 100 of our last issue.

**Petrol Restriction and Week-end Traffic.**

We rather anticipated a marked decrease in motor traffic on the roads during the week-end, due to the difficulty of obtaining petrol, but normal numbers were to be seen, while in the vicinity of the Thames we noticed no apparent depletion in the numbers of motor-propelled craft. One of three things is evident—that motorists are making a splash with their full month's supply, that numbers still have a good stock, or are eking out their allowance with paraffin or petrol substitutes; the latter seems the most likely, as the somewhat noticeably smelly exhausts denote.

**The N.C.U. Prisoners of War Fund.**

This fund was originated last summer when it was discovered that several cyclists were prisoners of war in the hands of the Germans, and entirely without food parcels from England. The fund is an excellent one, and has done much to alleviate the sufferings of those who have been taken prisoners, and it is interesting to note that several motor cyclists are among the number of prisoners receiving relief. Funds are very urgently needed, and should be sent to the Secretary, the N.C.U., Lonsdale Chambers, 27, Chancery Lane, W.C. One prisoner, Mr. W. R. Wuest, appealed for relief through the Auto Cycle Union, which forwarded the postcard to *The Motor Cycle*, which in turn sent it to the right quarter, and on receiving his parcels he has written the N.C.U. a very grateful postcard. He is especially thankful for receiving bread parcels. Another motor cyclist, Mr. Gordon Fielding, as well as Mr. Wuest, was touring the country when war broke out, and was interned.

**Petrol from Canada.**

The 4,000,000 gallons per month offer from a Colonial firm, mentioned in our last issue, was referred to in the House last week. The firm is the Crown Oil Co., of Ontario, but it appears that the tankers are still on the stocks, and it would be October before the petrol could be obtained. Even then, if the present heavy military requirements continue, such an amount would considerably relieve the situation all round.

**Lightweights in Africa.**

An officer who has taken part in the Cameroons campaign writes that the two-stroke lightweight should be invaluable in that quarter of Africa. A machine that develops a high speed is not wanted, but one that will burble along at about 20 m.p.h., and yet be capable of attaining 30 m.p.h. What attracts the writer is the possibility of picking a lightweight machine up (figuratively) and putting it in one's pocket when obstacles are encountered. He suggests as an ideal specification: Two-stroke engine, three-speed gear, stout tyres, and fairly sturdy build.

**A Strange Notion of Economy.**

One of the interesting revelations made in the House of Commons last week when Mr. Harcourt made his statement on behalf of the Petrol Control Committee was the fact that petrol for France is first of all brought to England. Here it is taken from the tankers and "canned," and then it is again shipped and sent over to France. Hitherto it has been taken for granted that petrol for the Army in France went direct, and the news that it does not is another instance of the entire lack of appreciation concerning the economy of labour and time shown by those in responsible positions.

G.W.R. porter filling petrol tank of two-stroke Allon at Pilning after machine and rider had come through the Severn Tunnel. At the end of this month the railway company intend discontinuing the practice of refilling petrol tanks at either end of the tunnel. Apparently a motor cyclist will have his tank emptied at one end and find at the other that he has no petrol.

**A.A. Scouts on Service.**

It was stated at the annual meeting of the A.A. and M.U. that 450 patrols had joined the Services. Those now on the road were either rejected or discharged men.

**The National War Funds.**

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£3,443,250 distributed)	..	..	£5,937,168	0	0
British Red Cross Fund	..	..	4,159,147	0	0
The Queen's Work for Women Fund	..	..	170,141	0	3
The Kitchener National Memorial Fund	..	..	191,000	0	0

**The Admiral Arbuthnot Trophy Fund.**

The latest subscriptions received for the Arbuthnot Trophy are the following:

B.S.A., Ltd.	..	..	£5	5	0
Hummer, Ltd.	..	..	5	5	0
W. Hughes Butterfield	..	..	2	2	0
North Wales Motor Exchange	..	..	1	1	0
L. Francis Jones, R.F.C.	..	..	1	1	0
C. Furlonger, R.F.C.	..	..	5	0	0

The total received now amounts to £93 16s. 0d.

**A New Road in Dorset.**

The Dorset County Council are about to construct a new coast road, and it is proposed to employ on the work a large number of German prisoners of war. The employment of war prisoners on road construction is a course we have advocated many times. In view of what has been done in France in the same direction, it is surprising it has not been done before.

**Petrol and the Severn Tunnel.**

The illustration on this page reminds one that riders of two-stroke machines lubricated on the petrol system find on arrival at either entrance of the Severn Tunnel that the railway company will not give them receipts for the tanks' contents. The petrol-oil mixture has to be emptied out, and, arrived at the other end, the rider must purchase more petrol. The alternative now is to take the Gloucester Road and cross the Severn by the ferry at Newnham.

**The Cheapest Substitute.**

A member of our staff notices no decrease in power with his water-cooled two-stroke when run on ordinary paraffin, purchased at a country store for the sum of 1s. per gallon. A speed of over 50 m.p.h. was obtained, while the consumption was over 70 m.p.g. During the week-end he covered a journey of 200 miles, 120 being done on a half-and-half mixture of petrol substitute and petrol, the return journey being accomplished on common paraffin, as stated above, starting at 5 a.m.

**Auto-wheels in India.**

At the Allahabad High Court, Mr. Justice Walsh, on June 23rd, decided that an Auto-wheel attachment is a bicycle, and should be taken as an ordinary bicycle. The owner had been summoned for using an Auto-wheel without a licence. His lordship held that the vehicle was really not a motor car, neither in the ordinary nor in the commercial sense of the word. A bicycle might be propelled presumably in various ways besides that of the ordinary from the saddle. It might be propelled before the wind with a sail. That was merely a temporary aid or attachment which was independent of the original construction and design of the vehicle.

## THE 1916 A.B.C. MOTOR BICYCLE.

### A Machine of Much Genuine Originality.

**G**ENUINE originality is very refreshing to a jaded journalist in days when most machines follow broadly accepted lines; the thrill of such novelties as the Scott and Douglas *débuts* is not a common experience. The A.B.C. machines occupy a unique position in that everybody is talking about them, whilst comparatively few people know them, since the factory is run on the system of a limited output of *de luxe* machines. They are further unusual in that they outwardly bear some resemblance to several well-known makes, but that inwardly they bristle with striking and valuable innovations. As one of the few riders who have taken delivery of the latest model, I may be allowed to discourse on its merits under two heads, separating the technical and practical aspects.

#### I.—Technical.

The machine is built regardless of cost, and its war price is £75, which is steep for a 500 c.c. twin; but this policy enables the designer to realise engineering ideals in lieu of building down to a price, a consideration which hampers most commercial engineers. The engine is the heart of the machine, and the A.B.C. engine differs from every other engine—car or cycle—which I have ever sampled in that it combines the maximum of efficiency with the maximum of refined running. It can hiss like a snake at 2 m.p.h. or bellow like a bull at 65 m.p.h. The first feature is obtained by an extraordinarily excellent balance; if the engine is run throttled down with the clutch out, a hand, laid on any portion of the machine, will feel no vibration. The speed and revving capacities are probably shared by several other first-class engines, though I fancy the A.B.C. has the legs of most; and in this connection it must be remembered that its specification includes every weighty luxury imaginable, and its total weight is probably about 300 lb. The main feature of its revolution work is that it does not get tired. The second gear ratio of the four provided is  $9\frac{1}{2}$  to 1; I have driven it for ten consecutive miles on this gear as fast as the country roads near my house permitted, and it was perfectly fit and fresh at the finish; I do not know whether it is more remarkable that I could stand this, or that the engine could stand it. Two unusual points of design are mainly responsible. On the average engine both piston and cylinder are made of the same metal (cast iron); the piston gets the hotter of the two and expands more; seizure is always a possibility with such engines under maltreatment. But the A.B.C. has steel cylinders, and either aluminium or cast iron pistons. The cylinders always expand more than the pistons, and seizure is practically impossible, so long as an oil film is maintained. Compression is safeguarded by fitting an overhead exhaust

valve on the top of the inlet valve, so that there is no "hot point" at one side of the cylinder barrel, and the tendency for piston or cylinder to warp, or expand in lop-sided fashion, is all but eliminated.

The technical knowledge and painstaking workmanship underlying these points are characteristic of the entire machine from stem to stern. The clutch, for example, is perfectly smooth in action, and is fitted with both hand and foot control, the leverage in both cases being so good that the little finger suffices to operate either lever or pedal. Both brakes go on as silkily as a spoon enters a tin of treacle; you cannot jam them, and the maximum power of the front brake is insufficient to lock the front wheel or upset the steering. The steering angle and balance are so designed that I can ride "hands off" at 45 m.p.h. Both cylinders can be detached, leaving the crank case *in situ*—an uncommon feature on horizontal twins; so can the magneto—but this point redounds rather to the discredit of other "flat" twins than to the honour of the A.B.C., as its arrangement is obvious. The gear box is made of phosphor bronze; many gear box troubles are ascribable to the shafts being mounted in less rigid materials. The gear lever is mounted at the best height and angle for convenient operation; four ratios—the maximum for practical purposes with a rigid drive—are provided, and the two higher gears, which often require interchanging at high road speeds, can be changed on the valve lifter, which is simpler than the use of the clutch. The chain drive is so adequately cushioned that it feels exactly like a belt in perfect condition; indeed, the machine can be driven with only one cylinder firing, full compression being retained in the idle cylinder without shock or jar being received *via* the transmission. The kick-starter is fully enclosed, and is dirtproof. An automatic carburetter is employed, which gives an approximately perfect mixture at all speeds, after the exhaust pipe, from which hot air is taken, is warmed up; in other words, after the first mile from a cold start. In actual practice, the mixture appears perfect after 300 yards, though there may be a tendency to choke under sudden accelerations for a mile on cold days. The frame is sprung fore and aft, without loss of lateral rigidity, and the springs deal indifferently with either horizontal, vertical, or compound shocks; yet they never bounce or clash. The handle-bar cannot loosen under sudden wrenches, e.g., in "scrapping" a hairpin bend with sidecar attached. The lubrication is mechanical and automatic, the rider's duty being limited to opening a tap on starting out, whilst a tilted sight feed glass informs him whether oil is actually

**The 1916 A.B.C. Motor Bicycle.—**

feeding. The standard engine develops over 12 b.h.p. In other words, the machine embodies all the theoretic ideals which motor cyclists are prone to associate with the millennium.

**II.—Practical.**

In actual riding it is difficult to imagine that the most critical purist could find any point to criticise, except the weight; and weight is naturally inseparable from a luxurious specification combined with substantial workmanship. Does a rider desire to travel slowly? He may climb the test hill at Brooklands at less than 3 m.p.h. without slipping his clutch, supposing he is an adept balancer. Does the user wish for a speed burst? He can do approximately 45 m.p.h. on second gear, 60 m.p.h. on third, and towards 70 m.p.h. on fourth. Does he prefer to potter at an even average of 25 m.p.h.? If he is a clever rider, he may maintain this pace exactly all day long irrespective of wind or gradient, as the machine will run steadily at this speed anywhere, if the correct gears and throttle opening be employed. Road vibration is as near as no matter non-existent. I made my tests over country roads, scarred all over with war potholes, and ridged by two deep ruts and a central hump. I failed to register any bumps up my backbone, and gentle bouncing was equally inconspicuous. The pistons never gum in the cylinders, and on frosty mornings, despite the temporary absence of a hot air

supply for the carburetter, the engine started in response to one or two thrusts of the kick-starter without any priming.

**Silent Gear Changes.**

The novice at gear handling need never be afraid of the changing. Provided he declutches, he may change "up" from first to fourth with his engine doing 4,000 r.p.m. and the gears will go in silently; or he may change "down" from fourth to second at 30 m.p.h. with his throttle shut and again no noise will be heard. Car experts will pardonably regard these two statements as fictions, but they are none the less facts. I do not know why Mr. Bradshaw does not communicate the secrets of his gear change to car designers, or why car designers do not puzzle over the A.B.C. gear box, until their gears are as changeable as his; but the incredible facts are as stated. I have several times all but unsaddled myself with the jerk caused by experimental changes of this character, but I have yet to hear the gear teeth scrape, so that damage to gears through careless changing is likely to be non-existent on the A.B.C.

In conclusion, I am well aware that the glowing claims which I now make for the A.B.C. will be taken with a grain of salt by my readers, but I think that as the machine becomes known riders will gradually be forced to admit that a machine of quite astounding intrinsic excellence has been added to our gallery of stars.

IXION.

**SCENES DURING THE THIRTY-SIX  
HOURS TRIAL OF THE  
DUTCH VOLUNTEER MOTOR BRIGADE.**

The total distance was 560 miles, which was run continuously except for the usual stops for meals. Quite a feature was the number of Douglasses, which performed remarkably well. A couple of two-stroke James also made a very good showing. Thirty-one competitors finished the total distance to time.

The upper of the large pictures shows three Douglas riders coming through Utrecht.  
The lower flashlight scene was taken at 3 a.m. at Leyden.

## PETROL SUBSTITUTES.

WE have had so many enquiries relating to petrol substitutes that the following list of fuels which we know are already on the market will probably be of service to our readers desiring to obtain a supply of any of these fuels:

"Benzolite."	"Wital."
"Petroline."	"Kempol."
"Petrolior."	"Petrofin."
"Beatsol."	"Binks Fuel."
"Russelline."	"Hall's Motor Spirit."
"Harwood's Motor Fuel."	"White Oil."

## SUNDAY MOTORING AGAIN.

THE *Daily Mail* has been taking a motor traffic census during the week-end, and found that on Sunday last between 9 a.m. and noon 86 motor bicycles passed through Maidenhead, 122 through Redhill, 75 through St. Albans, 47 through Tonbridge, 92 through Hatfield, and 21 through Godalming. This covers the Bath, Brighton, Holyhead, Hastings, Great North, and Portsmouth roads respectively. No comment is made upon these figures, the only remarks of importance being that, "Despite the drastic petrol restrictions motor car traffic on some of the great highways leading out of London is no less than it was two months ago."

It seems that the daily paper's idea is to get Sunday motoring stopped. If motor vehicles are used on Sunday only for healthful pleasure, we may say we think it would be an outrage to put a stop to their employment. It is suggested that the use of petrol leads to expenditure of money. Motor cyclists know perfectly well that it does not, but that it is a saving of money, and if one has to travel, even with petrol at the present price and the extra tax, it is cheaper to journey by motor cycle than by train. It

would seem that the census of the figures quoted would lead one to suppose that, despite the Petrol Committee's statements, there is still enough petrol left in the country to supply the needs of the Services and the private owner as well at least once a week.

## THE MEANING OF PROHIBITION.

READERS will share our astonishment upon glancing at the import figures for the month of July, the cause being the fact that, in spite of the so-called prohibition of imported motor vehicles, 253 motor cycles came into the country last month. The prohibition came into force, on paper at any rate, at the end of last March, but vehicles for which a deposit had been paid could be imported after that date. So it is to be presumed that the foregoing is the explanation. In the meanwhile it will be interesting to see which arrives first—the declaration of peace or the end of the stocks of foreign-built motor cycles on which deposit was paid by March 27th.

### IMPORTS.

	July, 1916.	June, 1916.	July, 1915.
Number .. .. .	253	57	495
Value—			
Complete machines	£11,386	£2,341	£24,442
Tyres and parts ..	£15,848	£12,851	£13,385

### EXPORTS.

	July, 1916.	June, 1916.	July, 1915.
Number .. .. .	866	1,016	881
Value—			
Complete machines	£37,227	£42,865	£39,924
Tyres and parts ..	£34,628	£28,322	£24,677

### PETROL IMPORTS.

There is a drop in the amount of petrol imported last month when compared with the same month of last year. The figures are:

July, 1916 ..	11,526,600 gallons.
July, 1915 ..	15,438,800 gallons.

Duty has been paid on 10,528,695 gallons during the month ended July 31st, 1916.

## STILL MORE PETROL FIGURES.

ACCORDING to the experiences of the Petrol Control Committee (and it should know), users, on the whole, did not make out extravagant estimates of their future requirements when filling in the petrol application forms.

The estimated requirements per annum of the owners of some 200,000 private cars and motor cycles show a total of 39,828,000 gallons. In 1915 the actual purchases of petrol by these owners, as indicated by the amount of petrol on which the full duty was paid, were 66,904,000 gallons. The census therefore revealed a voluntary economy of 27,076,000 gallons, which disposes of the idea that applicants in general, fearing a limitation of supplies, inflated their demands.

## "ON SERVICE."

L. T. S. A. ROWLANDSON has sent us a copy of the latest issue of *On Service*. It is quite up to the excellent standard set by previous issues, and there are one or two very amusing bits.

Rowlandson appears to be going strong. He tells us that there is always plenty of work to do. A few days ago some of the men at G.H.Q. were discussing Six Days Trials of the pre-war days, and Rowlandson stated that had he known, when going over the courses in Lakeland and Yorkshire, what machines were to be subjected to during the war he would never have agreed with the complaints made. He has about 400 machines to look after, and he says that even now, after two years of war, many of them are not up to the work in some respects.

## A VIEW OF THE DESPATCH RIDER.

LORD NORTHCLIFFE, in a most interesting article in Monday's *Times*, entitled "The Army behind the Army," pays a tribute to the despatch riders in the following words: "Supplementing the telephonic system is a telegraphic link, and there is also the wireless. The Army Signal Corps is to be congratulated on a fine achievement. Over and above these there are the motor despatch riders, some of whose experiences during the war have been as thrilling as those of our air boys. The noisy nuisance of our peace time roads at home has been a prime factor in the prompt waging of war. Motor cycles and portable telephones appear in the most out of the way spots. Far beyond Fricourt I met these cyclists making their way in and out and around the shell holes.

"A few days later when visiting one of the workshops at the base I saw the wrecks of similar machines twisted and smashed out of all recognition by shrapnel, each speaking of an adventure, and perhaps a tragedy. The fact that these derelicts were being examined for possible repair is a portent of the rigid economy with which, on the French side of the Channel, at any rate, and perhaps on both, the war is now being conducted."

### A SMART, HOME-BUILT SIDECAR.

It is canoe-shaped and ample protection is afforded for the occupant. It is finished in yellow with black lines, and attached to a 5 h.p. Indian. This is not the first body the owner, Mr. Hiskins, of Birmingham, has built, as reference to "The Motor Cycle" of October 7th, 1915, will show.

# TO TEST A CARBURETTER FOR WASTAGE.

## HOW THE LOSS OF FUEL WAS DISCOVERED AND REMEDIED.

IN the days when I used petrol as a fuel I carefully tuned one of my machines to give what I thought were maximum results as regards power and consumption for sidecar use. It accomplished approximately 75 m.p.g. at an average speed of 28 m.p.h., which was quite passable for a  $3\frac{1}{2}$  h.p. two-speed, used over really mountainous roads and during the truly appalling weather conditions which prevailed when the tests were made.

Then I took to using a heavy fuel with a flash point well above normal atmospheric temperature, and discovered, to my utter astonishment, that not only did the carburetter leak abominably, but that, at full throttle openings, it was losing almost as much fuel as it used, owing to blow-back.

At first I jumped to the conclusion that this loss occurred *only* with the *heavy* fuel, and since the leakage conveyed unsavoury reminiscences of the road to my own person (my right leg being near to the carburetter) I promptly put it down as one of the disadvantages in the use of a heavy fuel. A little careful reasoning, however, revealed the fact that if the wastage occurred with the aforesaid heavy fuel it must, indeed, occur also with petrol, *i.e.*, it had been going

engine, unless the induction pipe be of such length that it holds sufficient gas to damp the fluctuations of pressure, *i.e.*, to act as an air cushion. The up and down movement of a large inlet valve at the end of a short induction pipe is quite sufficient to cause blow-back.

The timing was next altered—result, tremendous “revs,” no British pluck on hills, quite unsuitable for sidecar use, original timing resumed. Other experiments proved equally fruitless—the blow-back could not be cured by any practical means.

The next step, then, was to prevent the wastage of the fuel which escaped from the air holes. This was finally effected by placing a muffle round the air holes, and by fitting, at the bottom of this muffle, a short length of copper piping connected with the hot air intake.

The accompanying sketch explains matters. Now this system has two huge advantages. The first is that any blow-back from the jets is caught by the muffle, and is at liberty to flow down into the hot air pipe, which is (or should be) warm enough to vaporise it completely. The second advantage is that warm air is drawn, *via* the copper pipe, into the muffle and past the jets, thus assisting carburation. Unless this air is warmed the effect of the hot air intake is very much modified by the cold draught meeting it from the jets. After running a mile or two, the muffle on my carburetter is quite perceptibly above the temperature of my hand.

These notes are written with reference to the Binks carburetter, but they apply to all carburetters excepting those which take all air past the jets.

### The Necessity of Warming the Carburetter.

In these days, when the quality of petrol varies, every opportunity should be taken for warming, not only the air supply, but also the carburetter body. By dint of careful adjustment and the inclusion of the above-named fitment, I now regularly obtain 100 miles per gallon with sidecar occupied, and 120, or thereabouts, solo—and this over distinctly trying roads. Moreover, it is always possible to run on paraffin, though the engine shows a tendency to overheat, so that there is no danger of being held up for want of fuel. On Binks fuel I obtain better all-round results than on petrol, and Broxburn light combustion oil, containing one quarter petrol, yields results as good, on a normal road, as petrol. I have convinced myself that these heavy fuels are completely vaporised, so that their use is not likely to damage the engine.

The pith of the article is, however, “If you wish to learn how wasteful your carburetter really is, try it with a heavy fuel. The leaks and splashes which are not shown with petrol will then become visible.”

H.M.B.

Method adopted to prevent wastage of petrol blown back from the jets.

on all the time, only it was not visible when petrol was the fuel used, owing to the instant evaporation of the spirit. With the heavy fuel, however, which did not vaporise at atmospheric temperature, solid chunks of the precious fluid could be seen dripping and spurting from the carburetter with each fluctuation in acceleration. Thus, by using the heavy fuel, it was found that the carburetter was, in reality, most wasteful in operation, though I should have dwelt in blissful ignorance of the fact so long as petrol was the only fuel used. Now, however, I realised why it was that the right leg of my overalls always became unspeakably disreputable when a small quantity of cylinder oil was mixed with the petrol.

### Preventing the Wastage.

The next thing was to prevent this wastage. The valve timing was carefully checked, and a stiffer inlet spring fitted. This did not improve matters, probably because the timing was already dead accurate, and the spring quite stiff enough. I am of the opinion that blow-back occurs with every single cylinder

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

LILFFE & SONS LTD.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### A Query.

Sir,—Have any of your readers heard of any experiments made with a petrol-paraffin mixture doped with methylated spirit? As methylated spirit contains little carbon, it might keep the cylinders clean. It is dear now (about 7s. 6d. per gallon), but my idea is that a small quantity added to plain paraffin would help it.

R. L. BOYD.

### A Variable Compression.

Sir,—I have been experimenting with Binks fuel, and find that lowering the compression makes a world of difference. In my engine, 8 h.p. M.A.G. twin, there are alternative plug positions, the unused ones being filled with a solid plug. I took out those solid plugs and put in a couple of spare sparking plugs. This had the effect of reducing compression, and the difference was most marked. I then had a couple of hollow dummy plugs made, and this was a further improvement.

I feel convinced from this that variable compression would be a great advantage at all times. It would postpone the period for decarbonisation, as knocking, I am convinced, is caused (with petrol) by the increased compression in a foul engine from the thickness of the carbon deposit, and not so much from overheating.

If one could increase the compression space as the engine got dirty, one could run for a much longer time without decarbonising.

DOUGLAS C. GROVE.

### A Youngster's Desire Fulfilled.

Sir,—I wish to thank you very much for recommending me for the Royal Flying Corps by forwarding my letter to Lt. B. V. Grealy. It was kind on his part also recommending me on the test card.

I may say I am very happy and hopeful of success after they have made me a soldier. I shall recommend your paper also, because it is the best and cheapest motor paper on the market to-day.

I send this with much joy and thankfulness for your kindness.

CYRIL P. MARRIOTT (2nd Air Mechanic, R.F.C.)

[The above is from the eighteen-year-old boy who, as mentioned in *The Motor Cycle* last week, page 77, had made such great efforts to enlist in the R.F.C. He had written to H.M. the King and the headquarters at Farnborough.—Ed.]

### Petrol Permits.

Sir,—With respect to the petrol restriction, upon which you commented in the last issue of *The Motor Cycle*, my licence is for two gallons per month, normal quantity eight gallons per month. A friend of mine has a light car, chiefly for pleasure, using four gallons per month; he has a licence for six gallons per month! My district is large and populous, and I have 208 miles of highways, many being sett-paved. We cannot grumble at restrictions, but surely, after being supplied with the nature of use and amount of stock (in my case none), the Petrol Committee might be fair.

R. CURTIS CORDON.

Sir,—The form sent out by the Petrol Control Committee telling us our fate bore these words, "The committee has considered your estimate of the amount you require . . ." Now I do not believe that the Committee have done anything of the kind. From what I hear they seem simply to have assigned to every owner of a motor cycle (doctors

excepted) six gallons in three months, and to every owner of a car twenty-four gallons, *irrespective altogether of the power of the cycle or car, and of the purpose for which it is to be used.* Could anyone have imagined a more futile arrangement?

Here am I, a country minister with a widely scattered parish to care for, sick people miles apart to visit, religious services in outlying villages to conduct, and I am to get a beggarly half gallon a week wherewith to do it. And here beside me is a man who does nothing, and keeps a small car solely for his own amusement, and he is to get two gallons a week to play with. Is it not stupid?

CLERICUS.

Sir,—As surveyor on a wide rural district, I use a motor bicycle. When applying for the petrol licence, I stated what it was used for, and hoped I would get a reasonable supply, as it was used on public work. I asked for eight gallons per month, and got two gallons. A motor driver here who uses a bicycle to come to town once a week asked for one gallon per month, and gets as much as I do. My district is full of soldiers. The traffic is extraordinarily heavy, and only one-third of my men are left, which means more running about for the surveyor. The military have broken down one large footbridge six times since the war started, which has cost me two hundred miles extra travelling to see it repaired. If I could only get the petrol wasted by the military in my district, I would be in luxury. One military friend told me when he wanted to clean his overalls he took a bucket of petrol.

One good may come of the shortage of supply. I ride a 2½ h.p. Sunbeam with Amac carburetter. Thanks to a tip in your paper, I put pins in the holes above the jet, and increased my mileage per gallon from 90 to 108. Then I added Spots, and on the last two-gallon can of Pratt's I got 134 miles per gallon. My running is done with many stops, and on a long run I am sure I could improve on those figures.

M.I.MUN.E.

### Petrol Waste.

Sir,—I fear that Mr. Addenbrooke's suggestion for running on coal gas is impracticable. My figures are probably not accurate as I have only memory to go on, but I think they are sufficiently near to prove my point. Coal gas is chiefly a mixture of hydrogen and methane (about 86% on an average). One vol. of this mixture requires, roughly, five vols. of air for its explosion—a much smaller proportion than petrol gas. The capacity of an ordinary 3½ h.p. engine is 500 c.c. or 30.5 cu.in., therefore in each charge there must be 6.1 cu. in. of coal gas, i.e., a cubic foot of coal gas will last for 286.5 explosions, or ten feet of gas will give 5,730 revolutions, say two and a half minutes' running of the engine. So that if Mr. Addenbrooke wishes to eke out his two gallons a month with coal gas he must be prepared to carry a sidecar full of gas cylinders!

(Rev.) J. M. PHILPOTT.

[We agree with our correspondent. *Gas*, of August 2nd, has a leading article on this subject, in which it is stated that 1,000 cu. ft. of gas roughly equal four gallons of petrol. A cylinder which will hold 100 cu.ft. of gas compressed to 120 atmospheres measures 4ft. in length and 6in. in diameter, and the weight of it is 1 cwt. This would suffice for forty miles on a motor cycle capable of doing 100 m.p.g.—Ed.]

## Restrict your lighting

—if **ECONOMY**—additional to the Lighting Laws—demands such a vital step, but restrict it wisely to the "Economical" service of the "P & H"—The **RELIABLE** Lamps.

"Restrict" it to the Dependable Lamp we illustrate—the "P & H" Projector Headlight, Model 127 H.B.

This widely-bought Lamp will efficiently meet your every lighting need—and to know fully about it let us send you our Art Booklet of the "P & H" MOTOR CYCLE LAMPS.

**Powell & Hanmer, Ltd.,** Chester Street, B'ham.

"P & H" Projector Headlight, Model 127 H.B.

This model is designed on ample proportions to ensure an exceptionally good light, and withstand excessive vibration. Has 6 1/2 in. Front; Real Mangin Mirror Reflector; Bray's "RONI" Burner, 17 1/2 Litres with Patent Adjustment for properly focussing the light; 5 1/2 in. Plate Glass Convex Lens; a new Registered design Improved Generator of large capacity and highest efficiency, and special Adjustable Carrier made of finest solid steel stampings fitting any shape handle-bar with lamp and generator in the necessary level position. Nickel-plated or Ebony Finish.

## The Secret of Tune

Lies in keeping *every little* detail of your engine and transmission in perfect condition. Good compression by no means ensures this—the valve heads may be perfect, while the stems and guides are worn. This will cause slight leakage, often affecting the mixture, and always causing noise and vibration when running on high speed. There may be a slight slackness at the gudgeon pin bearing, so slight that you hesitate to renew it. But if you had a lathe you would be enabled to turn up bushes, guides, valves, etc., at a trivial cost. *Then* you would not hesitate. Write for particulars of The "Drummond" 4in. Screw-cutting Lathe.

**DRUMMOND BROS., Ltd.,** Reed Hill, Guildford, SURREY.

LATHES

**A Praiseworthy Ambition.**

Sir,—In answer to the letter of T. Bardley, I should be pleased to give him free lessons on my  $3\frac{1}{2}$  h.p. Triumph. I am a school teacher on holiday for a month, and have ridden for four years. The only difficulty seems supply of petrol. Perhaps some other Manchester man could oblige. If not we can make the best of the gallon I have on hand.

HARRY WREN.

60, Gorton Lane, West Gorton, Manchester.

**Parts for Existing Machines.**

Sir,—Your article in July 6th issue on getting parts for existing machines has touched us in a very sore place, as here in Toronto we have between 130 and 140 Triumph machines running. We have always made it a rule to have every part in stock. We ordered in February parts worth hundreds of dollars, but we have not yet heard when we shall receive them. We are as patriotic as anyone, and would sink our business if it would help the Allies, but we have clamouring customers who want parts, as many use their machines for business purposes. We help out as well as we can by making spares, but you know this is impossible to do in lots of parts. We have now a score of people who have put their machines on one side, but we are helpless, and we know the Triumph people are on war work or they would send them. With the Indian agents here selling their twins for 275 dollars, England cannot compete. The English trade has certainly got a black eye in Canada.

The Excelsior lightweight, a copy of the Triumph, is selling here for 185 dollars, and the Triumph would cost us about 225 dollars to land here. What chance have we of getting a fair price?

Toronto.

TANGENT CYCLE CO.

**Is it in the Air?**

Sir,—In reply to the letter of "J.H." (August 3rd), we, the undersigned triumvirate, wish to convey to "J.H." that we will individually or collectively guarantee to trim him to a standstill over any road he may choose, and we will ride an American twin against him. He may choose any make of English twin. His letter shows him to be insular in the extreme. Before going further, we may state that we are three Canadian-born despatch riders, who have had board and dirt track experience; in fact, one of us holds the world's record at 104 m.p.h. on a three lap to the mile track on a machine which he built up himself in the factory.

The records of the Norton, Rudge, Triumph, etc., are a credit to their makers. Do we deny that they are authentic? Do we calmly sit down and practically accuse the officials who timed these machines of acting falsely? Then why should "J.H." insinuate that the Federation of American Motor Cyclists has falsified the rate of speed made by the Harley-Davidson? Has "J.H." forgotten that the Indian still holds the record for England, and that the Indian was beaten to a finish on July 4th, 1916 (not saying that the Indian will not give the others as good as it got before the season is out, it being a characteristic of this firm)?

Spread out, "J.H.," see what the world is doing around you—your heart is probably in the right place—and do not be too sceptical about what is going on a few miles from your back door.

H.F.M.  
L.M.P.  
J.A.M.

**American Motor Cycles.**

Sir,—Being an enthusiastic reader of your paper and a keen follower of readers' opinions, as expressed in your correspondence columns, I should like thoroughly to endorse "H.E.R.'s" letters re "Twins." With him, as with me, singles are anathema; in fact, I may say, in my opinion, the three most popular brands of singles are the worst. I had better not mention names.

I have constant riding experience of all classes of machines, and I find the machine for solo riding is undeniably the 7-9 h.p. clutch model Indian, and for sidecar work I use a 7-9 h.p. American Excelsior. These two I ride constantly, together with a  $2\frac{1}{2}$  h.p. Campion two-stroke for short journeys, and, with "H.E.R.," I can honestly say that for power, springing, design, steering, large wheels, tyres, saddles, and ready-to-ride machines, the 7-9 h.p. Yank undoubtedly gets there every time.

HUGH BROCKLEBANK.

Sir,—There seems in your columns of late a tendency to criticise British machines unfairly, and to hold up the American motor cycle as the acme of perfection. Especially is this noticeable in the letters from Colonial correspondents.

I am sure many readers, like myself, must have waited patiently for some answer to these criticisms from the British manufacturers, but apparently none is forthcoming.

Possibly our makers are content to let their wares speak for themselves, and leave the matter to the intelligence of the motor cycling public, but are they not depending too much on public intelligence (which is always an unknown factor), and is "the man in the street" capable of judging a sound engineering job when he sees it? In any case their silence seems questionable business policy.

Undoubtedly it is a small minority in this case that makes itself heard, but I am afraid in this world a noisy minority will always be a more potent factor than a silent majority. The new recruit to motor cycling is likely to be prejudiced by adverse criticisms, which are allowed to go unchallenged.

The American manufacturer is to be congratulated on making an almost foolproof machine, embodying an automatic carburetter, mechanical oiling, etc.; he will always find an extensive market amongst a certain class of rider, who demands an absolutely foolproof machine, with a large reserve of engine power to allow for his shortcomings in tuning, driving, etc. There is, however, a far larger class of man, who takes an intelligent interest in his machine, who keeps his engine in respectable tune, who can be trusted with a two-lever carburetter and a positive oiling system, to whom the economy of the medium-powered mount will always make an irresistible appeal, and it is for this class mainly, I think, that the English maker caters.

I think I may say, without fear of serious contradiction, that our English manufacturers have nothing to fear in the matter of workmanship, material, or design from any of the foreign rivals.

P. C. KERSLAKE-SMITH.

**A COMPARISON—LIGHTWEIGHT MOTOR CYCLE AND HEAVYWEIGHT LOCOMOTIVE.**

If a South African were asked the quickest means of travel, he would say on rails of course! But the motor cycle has proved otherwise. One of the new two-stroke Indians, ridden by Jordan, raced a train from Johannesburg to Durban and beat it by 1 hour 39 min. Jordan's time for the 470 miles was 19 hours 59 min. =  $23\frac{1}{2}$  miles per hour.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### How to treat a New Mount.

**?** I am taking delivery of a new 6 h.p. motor cycle, and as I have never had experience of a new machine before, perhaps you could give me some tips as to the best way to run the engine in. Should I drive the engine slowly for some time?—T.L.

The great thing is to run the machine well within its power, and give it plenty of oil. You may reckon the machine will be run in after about 1,000 miles, but it should be greatly improved at the end of 500. You should on no account over-drive it. This is most essential in the case of a new machine.

### Magneto Timing.

**?** Having removed the magneto chain from my  $3\frac{1}{2}$  h.p. single, I am experiencing difficulty in re-timing the magneto. I should therefore be glad of your advice on the matter. Would you also tell me the cause of petrol spraying back through the air inlet opening? A friend tells me that a longer inlet pipe would stop this.—R.G.

The usual timing for the magneto is as follows: Place the piston on top of the firing stroke—that is, first top dead centre after inlet valve has closed. Place the ignition lever two-thirds retarded, and connect up the driving chain with the contact points just about to break. Some machines will take more advance than this, others less. Blow back from the air intake is fairly common on some machines, and excessive blow back may be caused through wrong timing or weak

valve springs. A short length of pipe attached to the air intake opening will save much petrol wastage from this trouble.

### Carburettor Adjustment.

**?** (1.) I have a  $2\frac{1}{2}$  h.p. Villiers engined two-stroke motor cycle, with an Amac carburettor. I consider that the petrol consumption is high. I cannot get more than 70 m.p.g. Can I do anything to improve this? The engine runs well with the air lever wide open on the level, but if the lever is closed slightly the engine fires back into the carburettor until the lever is only open about one-third. On hills the air lever has to be closed to about one-third open. This seems to me queer. (2.) Do you consider half petrol and half paraffin could be used on a two-stroke without damage to the engine? I am afraid of the paraffin condensing in the crank chamber.—J.E.V.

(1.) Two-stroke engines are naturally rather heavy on petrol, but we consider you ought to be able to get rather more than the figure you state. The only thing you can do is to experiment with different sized jets. To get the best possible results you need to have the engine and machine generally in perfect order. (2.) We think you will be quite safe in using a percentage of paraffin mixed with your petrol; but when doing this it is advisable to have some means of heating the mixture before it is admitted to the engine—fitting a hot air intake pipe to the carburettor will assist matters. Provided the mixture is properly vaporised no trouble will be experienced.

### Swivelling Head Lamps.

**?** I understand that certain lamps are taboo in sundry coastal districts. This is a very difficult matter for novices like myself, as we cannot be expected to understand fully the requirements of the law if those requirements are made to vary in different towns. Personally, I should like an expression of opinion from you as to what kind of lamp fully satisfies all demands. I have a P. and H. head lamp fastened to the handle-bars by two nuts, and this can be tilted by simply releasing the nuts. Is this lamp all right?—J.C.

Swivelling lamps, or lamps which are capable of movement in any direction independent of the machine, are illegal throughout the country. You should have your lamp securely fixed to the bracket. This can be done either by means of riveting, or it might be securely sweated. At a recent court proceeding, the magistrate stated that the only really satisfactory method of securing the lamp was by brazing, but this is a lamp maker's job. The regulations which vary according to district are the dimming regulations. In all coast towns discs with six  $\frac{1}{4}$  in. holes, in addition to one thickness of tissue paper, are necessary. This amount of dimming is quite satisfactory for any part of the country, though in many parts inland the perforated disc is not compulsory, while out of towns in certain parts no dimming at all is necessary. Particulars of this appeared in *The Motor Cycle* of January 13th.

Sidecar outing for convalescent soldiers at Basingstoke. A few of the passengers with the motor cycles and sidecars in the grounds of the hospital.

# 10,000 GALLONS

**FREE FROM  
PARAFFIN**

## PETROLIOR

**NO SPECIAL  
CARBURETTOR  
REQUIRED**

### The Petrol Shortage Solved

#### THE PRODUCT.

A straight distilled water white spirit of petrol type and odour.

Flash approximate .. 78°-80°

Total distillation .. 195°-200°

#### ITS USES.

Used neat or mixed with petrol or paraffin as desired, a far cleaner and sweeter spirit than much of the petrols now on sale.

#### CARBURETTORS.

Will vaporise in any and every type of carburettor. Machines fitted with controlled air inlet or a rough warming jacket round induction pipe gives absolutely perfect results.

Prices of Packages  
see below.

For many years past we have handled hundreds of thousands of gallons of this spirit for special technical work, and the discovery of its adaptability as a motor propellant is due to old clients' reports as to the uses to which they were adopting this spirit. The regular flow of repeat business proves the efficiency of the product.

### Removing a Two-stroke Cylinder.

I shall be glad if you would kindly tell me how I can take off the cylinder of my two-stroke without removing the magneto.

When I have taken off the petrol pipe and carburetter and want to remove the exhaust pipe, one end of which is in the cylinder and the other end in the silencer, can I do so without lowering the silencer? The magneto is on top of the silencer and appears to me to be fixed to the silencer and not on a separate platform, therefore, to decarbonise the cylinder, it seems that I have practically to take down the whole thing, which, I think, ought not to be necessary. I do not want to interfere with the timing if I can help it. I shall be obliged if you can give me the necessary instructions.—NOVICE.

After removing the holding-on nut you could very probably remove the exhaust pipe by unscrewing the holding-down nuts of the cylinder, and slightly raising it from the pipe. If you have to remove the magneto it is perfectly easy to replace it properly and set the timing as follows: You must get the piston on the top of its stroke, fully retard the magneto, and turn it till the points are just breaking, then couple up.

### Throttle not Shutting.

I am not satisfied with the carburation of my machine, and should be grateful to you for advice. It is a Chater-Lea combination, with 8 h.p. J.A.P. engine and Amac carburetter, date 1913. When I got it last year, following instructions and my practice with a former machine of 3½ h.p., I used to set the air lever open one-third and then run on the throttle lever. This was excellent against the wind or an incline, but on the level speed was far too great for the narrow roads hereabouts, and my progress was by a series of bursts, disconcerting to myself and passenger. I found by experiment that on a favourable road I could run at an easy 20 m.p.h. with the throttle lever shut tightly, varying the speed by the alteration of the air lever, opening or shutting it as less or more power was needed. Also in town driving I found it best to run on second speed with the throttle shut and manipulating the air lever. If the third speed is in and the throttle shut the air lever has to be open wide to keep the engine from roaring; but then there may be a sudden stop if I am not quick in regulating the air. It seems as though there were some arrangement in the setting of the throttle barrel so that it never quite shuts, and the suction is so perfect that enough gas can be got if the air does not make it too weak. The running is quite good at fair speeds, and I get 50 m.p.g. with self and passenger weighing over 20 st., but I feel that something better should be had when slow running is necessary.—N.B.H.

There is something very wrong in your carburetter adjustment, for if correctly set you should be able to stop the engine by shutting the throttle fully, irrespective of the position of the air lever. Running the machine as you have been doing is both extravagant and likely to do damage

to the engine. It appears as though the throttle slide is sticking for some reason or other. The return spring may be broken, or may have lost its strength. There may be grit between the slides, or the Bowden cable may be insufficiently long to allow the slide to shut completely. You should remove the control slides—a very simple operation—and make sure none of the above faults exist.

### READERS' REPLIES.

#### Firing with a Closed Throttle.

I notice in your "Questions and Replies" column in your issue of July 20th a letter from one "S.B.P." complaining of intermittent explosions after closing the throttle on his two-stroke. I used to have the same trouble with my own engine, although the throttle seemed quite shut, but I have cured it now by fitting an ordinary compression tap in the induction pipe, which I open when descending a hill. Incidentally, I generally keep it open when the engine has become warm, as I find it pleasanter to be able to shut off the engine at all times without the objectionable spluttering which occurred formerly, and at the same time it makes little difference to the running—except at starting—and only means a less frequent manipulation of the air lever. Some weeks ago your correspondent "Ixion" mentioned the advantages of the B. and B. variable jet carburetter on two-stroke engines, and I can quite endorse his remarks, as I find it has cured my engine of four-stroking at all speeds, and has given me much more power on hills, while it has improved the petrol consumption, now enabling me to get forty miles per gallon more than the previous fixed-jet carburetter. My machine, a 1915 Connaught standard, has run the last 3,850 miles on twenty-eight gallons of petrol, this working out at 137.5 miles per gallon. I have found with my machine that a carburetter addicted to four-stroking habits causes a much more rapid carbonisation of the engine, for the original single-jet carburetter made cleaning necessary every 400 to 500 miles, while the present B. and B. only makes it necessary every 800 to 1,000.—RALPH CHAPMAN.

#### EXPERIENCES WANTED.

"J.P." (Lincoln).—3½ h.p. Scott running with petrol and paraffin mixture.

"A.L.M." (Portsmouth).—Running of 2½ h.p. James or similar machine on paraffin (100% or less mixture), especially with regard to effect on engine lubrication.

### SPECIAL NOTICE.

#### "THE MOTOR CYCLE" FOR NEUTRAL COUNTRIES.

Under the existing regulations, copies of newspapers may now only be sent to neutral countries in Europe, America, and Africa if posted direct from the office of the publishers or by newagents who have obtained permission from the War Office for the purpose. The publishers of *The Motor Cycle* have obtained the necessary permission, and, consequently, can post copies for subscribers as usual. The subscription rates to all neutral countries are 10/10 per annum; six months, 5/5.

THE PUBLISHERS,  
"The Motor Cycle," 20, Tudor St., London, E.C.

### Bradbury Balance Sheet.

The statement of accounts of Bradbury and Co., Ltd., Oldham, for the year ending June 30th, 1916, shows a profit on the year's trading of £33,910 2s. 1d. The directors recommend a dividend of 10% on the preference shares and 1s. per share on the ordinary shares.

### A New Darlington Firm.

Mr. C. W. Smith, a Darlington motor cycle agent, has gone into partnership with Messrs. A. E. Oates and R. Oates, formerly of the Northern Sidecar and Motor Co. (Darlington), Ltd., which went voluntarily into liquidation. The headquarters of the new concern are in Northgate, and the building of sidecars will shortly be proceeding apace.

### Catalogues Received.

The latest catalogue of Messrs. Brown Brothers, Ltd., 15, Newman St., W., is, as usual, an instructive volume. A novel feature is the section devoted exclusively to motor cycle accessories. It begins by giving illustrations and specifications of the two types of the Vindec motor bicycle, which is one of Brown Brothers' specialities. Of these there is the 2½ h.p. two-stroke and the 6 h.p. sidecar. Among the accessories we notice all the very latest in the motor cycle line.

### Good Hill-climbing by a Lightweight.

The owner of a 2½ h.p. two-speed Calthorpe-Jap writes that during a holiday tour in Devon he made clean ascents of Lynmouth and Dartmeet Hills, the latter with a passenger on the carrier. The total distance covered was 770 miles, and the petrol consumption, we are told, worked out at 102 m.p.g.

### Engineering Standards Committee.

At a special meeting of the Main Committee (Sir John Wolfe Barry, K.C.B., chairman), held on July 27th, Mr. Charles le Maistre, A.M.Inst.C.E., M.Inst.E.E., who has been in charge of the work of the Electrical Section since 1903, was appointed secretary to the committee in succession to the late Leslie S. Robertson, M.Inst.C.E., who was lost with Lord Kitchener in H.M.S. *Hampshire*.

### History of a Great Company.

The Crimean war was responsible for the bringing into being of concerns which in these days are a great national asset—the Birmingham Small Arms Co., Ltd., of Birmingham, for instance. The origin of this company dates from 1855, when the gun makers of Birmingham were called upon by the Government to furnish arms for use in the Crimea. A history of this concern has been published, entitled "B.S.A. History from the Days of the Crimea to the Great War." The illustrations show the Enfield muzzle-loader of 1857, as well as illustrations of all the rifles made by the company up to the present Service rifle.

### EXTRACTS FROM RECENT LETTERS.

"I cannot give even an approximation of the mileage belt has done, as I ride, more or less, every day, winter and summer. Since I have had the belt I have twice toured the Lake District (it having taken me over Honister and Kirkstone), once through Derbyshire and North Wales, and once through South Wales and Somersetshire; also to the South and West of Scotland. A lot of my riding is done over the Yorkshire Moor and Coast roads."

"Having tested your belt and given it a good trial I think it only right to let you know the result. Since I took up motor cycling, eight years ago, I have had nothing but trouble with belts—slipping, stretching, and short life; since using the 'ZILLA' I have been quite free from all belt trouble. Anyone using a Rudge-Multi or other variable geared machine should not hesitate but use a 'ZILLA' and say good-bye to other makes."

Take the advice of experienced riders and order at once.

## READ!

### MY 3-PHASE JET DAMPING CARBURETTERS

have such perfect vapourising properties that they enable you to use fuel at 1/10 per gallon in 42-gallon casks, which you are allowed to keep on your premises. Your engine will tick over dead slow, and pull dead slow in traffic, yet give the full power. It is almost impossible to tell you are not running on petrol at 2/9 a gallon. It cannot damage your engine or soot it up, and makes Motor Cycling possible in these times.

I give you my personal assurance of the truth of what is stated above. Please send at once for full particulars of the carburetter, and also for my Treatise on Carburation, and terms of One Month's Approval Trial.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd.**, and crossed **& Co.**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## Are Imports Prohibited?—No!

**W**HAT must have occasioned a good deal of surprise to our readers was the mention in our last issue of the large number of motor cycles imported during the month of July. Our figures, which were culled from Board of Trade returns, showed that 253 machines, of a value of £11,386, and parts to the value of £15,848, were imported into this country. Seeing that imports of motor vehicles were supposed to be totally prohibited in March last, the extent of the figures will cause much astonishment. One can well understand that machines expressly made for the British market, and embodying some more or less special detail in their specification, have a right to find their way to this country. Particularly is this the case when a deposit has been paid on the order. As no differentiation is made in the Board of Trade returns between touring and commercial motor cycles, it is impossible to tell how many of the 253 machines received in this country last month have sidecarriers attached or are intended for goods delivery. At the same time it is well to recall that as from July 6th last the importation of commercial motor vehicles (in which are included sidecarriers) and chassis was prohibited except under certain conditions, the latter being more generous than in the case of pleasure cars and cycles. Even allowing for all this, however, it does seem extraordinary that during the four months ended July, a total of 1,020 machines, which together with parts were valued at £99,558, should find their way to this country. Quite apart from the question of whether or not such imports should be accepted, one wonders what the future owners of these thousand odd machines will do in the matter of petrol. If they are to be allotted the usual amount, then the petrol situation will become more acute. For comparison, the British exports during the same period totalled 3,403 machines of a value of £276,500, including parts.

## Progress.

**I**N spite of the war and the fact that many motor cycle factories are at present engaged on Government work and the manufacture of munitions, we have been enabled to chronicle in recent issues the introduction of many striking innovations and improvements as well as much real progress in the matter of detail. We will refer briefly to a few examples only, which prove that the brains of our designers have not been idle.

No sidecarist, actual or potential, can have failed to be impressed with the great ingenuity of the weatherproof sociable sidecar outfit recently illustrated and described. Whatever individual views may be held as to the general appearance or the desirability of adding a fourth wheel at a considerable increase in the first cost, in taxation, and in running expenses owing to extra weight, there can be no two opinions as to the excellence and originality of the mechanical details, which go to make up the complete whole, or to the great amount of study and consideration involved in the production of such a vehicle.

Another innovation is a motor cycle frame which is duplex throughout and so arranged that any engine, single or twin, can be accommodated within the side members. The springing of the saddle has not been forgotten, but we think it would increase the comfort of the rider if the footrests or the rear ends of the footboards were suspended on the same springs.

A large step in the right direction has been taken in the matter of lubrication, and a mechanical pump is being placed on the market which can quickly be fitted to almost any make of motor cycle. The amount of oil is controlled by the throttle lever so that more oil is given when required.

We also hear that a firm renowned for single-cylinder engines has an experimental twin on the road. All this is good and indicates keenness and progress.

## SOCIABLE SIDECAR DESIGN.

Flat Triangulated Frame and Rear Steering.

Side and end views and plan of the Vickers sociable rear-steering sidecar.

NOW that the Scott sociable has set the fashion in sidecar design, we may expect to see many examples of similar constructions in the near future. It seems fairly obvious that the luxurious sidecar outfit in which the sidecar is intended to be permanently attached to the motor cycle must, if it survive at all, follow these lines.

The designs which we publish on this page are the patent of Sir Arthur Trevor Dawson and George Thomas Buckham, both of Vickers, Ltd.; patent No. 9,392, 1915. Contrary to usual sidecar practice, the steering wheel is in the rear, and

either, or both, of the front wheels can be made to drive. Rear steering tricycles have, of course, been made before, but the steering wheel has generally been in the middle, thus making a three-track vehicle.

### Constructional Details.

In the design under review the main frame consists of two isosceles triangles lying obliquely one above the other and having the axle of the front wheels as their common base. These are joined at the apex by a short strut, which thus forms two other isosceles triangles having

the strut for their common base. From this base another triangle is carried to the right, to which is fixed the trailing wheel, and this last triangle is further supported by a tube connecting it to the other end of the axle. This results in a very stiff and strong frame, which is entirely triangular. It is intended that the occupants of the vehicle shall be seated side by side well forward over the front axle. The position of the engine is not indicated, but, presumably, it would be fixed much as in the Scott machine. We await further details with interest.

## DOUBLE PLUG IGNITION.

Are Two Sparks More Effective than One?

THE query in our issue of August 3rd with regard to having two plugs in each cylinder igniting simultaneously has brought a most interesting note from Messrs. The Sphinx Mfg. Co., who have been conducting experiments with double plug ignition. They tell us they have succeeded in obtaining fairly satisfactory results without either a special magneto or a double-pole plug. The first method they adopted was as follows: The high-tension wire was conducted in the ordinary way to one plug, the current for the other plug being induced by taking a branch lead from the main high-tension cable to a condenser, and so to the second plug. The condenser has the effect of producing an induced spark in the plug of an intense nature upon the breaking of each impulse of the main high-tension current. In practice this is practically instantaneous with the original spark. Another method tried was by leading the main high-tension cable direct to the condenser, and then both the plug cables are taken from the condenser, which divides the

current, so to speak, into two separate sparks. Either of the above methods is capable of producing two instantaneous sparks of sufficient intensity to cause ignition.

### Actual Tests.

These two methods were tested on

Two methods adopted by Messrs. The Sphinx Mfg. Co. for producing two sparks simultaneously without using either a special magneto or spark plugs.

several types of a well-known make of engine, but the results have not been too promising, the increase in power being negligible, and, in fact, a single plug placed in the usual place, over the inlet valve, gave better results than one plug in this position and one in the cylinder head. The exhaust gas was analysed and found to contain a certain quantity of unexploded gas. Upon analysis when using the two sparks the exhaust was found to contain less unburned gas, yet the actual results were in no other way superior to those obtained with a single plug. The cause for lack of improvement is suggested to be that the multiple sparks are individually weaker than the single spark, which occasions difficulty in starting and a tendency for the plugs to become easily fouled. Under the circumstances it would seem that, unless a means of producing two really powerful sparks is at hand, better results are obtained by using one fat, healthy spark, which causes very rapid ignition, rather than two separate sparks of somewhat doubtful quality.

## A TEST OF PETROLIOR.

A MEMBER of our staff has been trying a petrol substitute known as Petrolior, which is a colourless spirit emanating from the same origin as petrol, but one that does not come within the regulations affecting petroleum spirit. The flash-point is between 78° and 86°, and the total distillation between 195° and 200°, while the specific gravity is .778. It can be used pure or mixed with from 5% to 25% of petrol. It has no objectionable smell.

The engine started on the fuel with-

out difficulty. At first it did not run very regularly, but improved a little when warm. Petrol was then added in the proportion of two parts of petrol to one of Petrolior. Starting was not easy, and the engine ran rather erratically until it had warmed up, when little difference could be detected between the running on Petrolior and on petrol. In the open country the power on hills seemed to be just as good as ever, but there seemed to be a rather greater tendency to knock. This was the first

of a series of experiments with the fuel, which we shall try with varying proportions of petrol. It is to be sold in any quantity, and information concerning it can be obtained from the Petrolior Co., 23, Kingly Street, Regent Street, W.

A buttonhole badge is being distributed by Douglas Bros., of Bristol, and any reader may have one on application. They are in two varieties, one for buttonholes and a second pattern with a brooch for ladies' use.

## OCCASIONAL

## COMMENTS

By "IXION"

Sydney R. Jones

**Petrol that is not Petrol.**

A rider of my acquaintance has been using the petrol-paraffin mixture, not for the past three months, but for the past three years! He asks me to warn readers that the stuff now sold as petrol will not stand anything like the admixture of paraffin which the petrol of, say, 1912, would bear, and that experimentalists should be careful to use one of the alleged higher grades, and not No. 2 or commercial spirit. I publish the tip for what it may be worth, as I noticed a similar suggestion in a recent issue.

**Some Control Oddities.**

I see the Petrol Committee is attempting to excuse some of the oddities of its procedure by explaining that its staff is rather inexperienced. Its inexperience has been kind to me, as my book authorises me to buy just twice the amount of petrol specified in the original docket. For a similar reason, one supposes, a friend of mine has been allotted 50% more fuel than he asked for. Neither of us is inclined to be harsh in our criticisms. On the other hand, some severity should be applied in revising the lists at the end of the first quarter. Many users have been ranked in Class B who have no earthly right to be there. The astute cynics who applied for three and four times their past consumption have in many cases received more petrol than they ever dreamt of buying in the halcyon days of peace. Petrol has been claimed for starred occupations, so to speak, by persons who actually employ it partly in joy rides and partly in hiring work, minus a hackney licence, and so forth. The scheme is by no means as bad as some critics pretend, seeing that it was necessarily rushed through on very scanty and unreliable information, and that amid the pressure of a great war; but it badly needs the equivalent of a King's Proctor to eliminate many injustices, many hardships, and many dishonesties.

**Inflated Estimates.**

Personally, I was rather surprised that Mr. Harcourt meekly swallowed users' estimates, and, further, went out of his way to compliment motorists on their honesty. He explained, on the one hand, that the civilian consumption in 1915 was 111,000,000 gallons, and that the estimates for the next twelve months amounted to 153,000,000. This one fact is sufficient to make us smell a rat, for we all know that pleasure motoring has dwindled extraordinarily during the last twelve months; and if the defects of war railway services and the loss of men and horses have induced many firms to resort to motor transport, the net result of reduced pleasure motoring and increased motor delivery work cannot possibly produce a 42,000,000 gallon rise in civilian consumption. Mr. Harcourt's estimate of our honesty as a class is based on the fact that "85% of motorists only asked for

from eight to twenty-four gallons a month." Striking a mean, this implies that the bulk of private owners asked for, say, four gallons a week, *i.e.*, at the rate of nearly 20,000 miles per annum for motor cyclists, or of 6,000 miles per annum for light cars. The authorities should know, probably do know, exactly what percentage of the motorists of the country own motor cycles and light cars (*i.e.*, comparatively economical vehicles in respect of fuel); but, from my private experiments and tests with the returns, I should say that the mileage indicated by the total estimates works out at about four times what is actually being covered. Further, I know that many patriotic owners deliberately cut down their requirements to the absolute minimum, and asked for half the amount of fuel which they were actually buying at the time of the committee's appeal. It would, therefore, seem that a selfish minority indulged in some particularly steep lying, and that the guileless Mr. Harcourt has been pretty outrageously hoodwinked by some of these dishonest gentry.

**A Side-prop Stand for Heavyweights.**

Does any reader know if an old type of stand, once fitted to the Matchless machines (and consisting of two separate legs, each of which could be used to prop up the machine or both simultaneously to lift it) is still being made? I have one or two enquiries from elderly users of heavy solo machines for a stand of this type. They say, with some justice, that they do not care to raise the tail of a 3 cwt. machine six inches off the ground except when it is absolutely necessary; and that a side prop is all that is needed at stoppages where no serious repairs are in contemplation.

**THE RESULT OF MILITARY EXPERIENCE OVERSEAS.**

The B.S.A. machines used in the German East African campaign are fitted with auxiliary back stands in the form of props as illustrated. These are very necessary in sand and loose ground.

## Controllable Mechanical Lubrication.

A Best and Lloyd Positive Feed Oil Pump, having a Variable Stroke, governed by the Throttle Lever.

FOR years motor cyclists have clamoured for a more certain method of lubrication than the usual "hit or miss" hand pump type or the drip feed. We have urged, in this journal, from time to time, the

Sectional view of the new Best and Lloyd pump.

development of mechanical lubrication, and it has been our belief that perfection will not be approached until the feed of oil to the engine is governed with the throttle opening, so that the engine shall supply itself with just the proper amount of oil needed according to the work it is called upon to do.

We have seen in the past mechanical lubrication alone, and throttle controlled lubrication alone, but what, we believe, is the first attempt to combine the two methods is now being developed by Messrs. Best and Lloyd, of Cambray Works, Handsworth, Birmingham. It consists of a small pump run preferably off the timing gear by worm drive. It is intended to be fitted to the side of the crank case. An eccentric cam operating on the roller head of the pump plunger makes the necessary down-stroke, the return being given by a small spring of piano wire. Two ball valves in the lower part of the casting alternately admit and let out the oil.

### The Variable Stroke.

So far the construction is simple. The unique point of this pump is in the control of the stroke. Surrounding the pump shaft is a movable drum, slotted first vertically and then diagonally to a stop. There are three of these slots, and the diagonal portions vary, being  $\frac{1}{4}$  in.,  $\frac{1}{2}$  in., and  $\frac{3}{4}$  in. high respectively. Only one of these slots is in action at a time, and the shape of the slot

determines the stroke of the plunger. Having once found, by experiment, the slot most suitable to the engine, it need not be altered, except to allow for big changes in temperature and consequent thickening of the oil, as from summer to winter. The wire from the handle-bar control to the throttle lever is passed through the guides provided, and coupled up to a peg on the movable drum, so as to rotate the drum to and fro at the same time as the throttle opens and shuts. The diagonal part of the slot then comes into operation, the drum rises as it turns, and so allows a greater lift to the plunger, thereby increasing the flow of oil to the engine. The actual lifting of the plunger is done by the coil spring, the slotted drum only controlling the amount of the lift, whilst the revolving cam above compels the down-stroke.

### The Sight Feed.

The oil supply is taken from the usual position in front of the tank,

The variable stroke pump is shown fitted to a Lea-Francis twin to supply through a sight feed on the tank and thence to the engine. A cover is, of course, provided.

Front view of the pump.

and the delivery may be either direct to the engine or back to a sight feed on the tank, and thence to the engine. With a sight feed in use the variations can be distinctly seen, from an occasional drop every five or ten seconds when the throttle is shut to a considerable jet of oil every one or two seconds when the throttle is fully open. Also a distinct difference in amount passing is noticeable, according to which of the three slots is in operation.

The cable control need not be in one with the throttle; a separate lever and wire could be used, or one lever on the bar could operate two separate wires at the same time. The worm drive is geared very low—about 62 to 1—and as this and the sliding parts are the only points of friction, the chance of wearing is very slight. It appears that there are only two things which could stop the pump's action—the breaking of the control wire and the possible

**Controllable Mechanical Lubrication.—**

breakage of the coil spring. In the first case, repair is a simple matter; the

Slotted drum which gives the variations in stroke.

chances of the latter mishap are very small, and fitting a spare spring is very easy.

**A Practical Test.**

We have seen the pump working both on the bench and fitted to a twin motor cycle. In both cases there was not the slightest doubt about its action. The oil feed increases or decreases exactly as

the throttle lever is moved. For all practical purposes, it does not impose any extra load on the engine, is quite noiseless, and, being small, only 4in. by 3in., and projecting 1 1/2 in., in no way does it affect appearance or accessibility. The approximate weight is 20 oz. The makers say that only a couple of hours' work by a mechanic are necessary to fit it to any motor cycle. The use of aluminium wherever possible makes the additional weight very little, and a neat metal cover renders it quite weatherproof.

We are quite sure that this innovation, despite its small size, does not lack

Side view of pump showing projecting shaft driven off timing gear.

efficiency, and that it, or further developments of it, will become a regular fitting to all motor cycles worthy of the name.

Messrs. Best and Lloyd have already built up a big reputation. Their many types of lubrication fittings are well known throughout the motor world, and this variable stroke oil pump promises considerably to enhance that reputation. At the present time the pump is not on the market, but the makers will be pleased to supply specimens for experimental work to interested firms. Their factory is one of the many Government controlled establishments, and supplies to the motor cycle market must be deferred until *après la guerre*.

**FOUR DESPATCH RIDERS PROMOTED.**

WE hear that Sgts. F. C. Schofield and E. S. Howard and Cpls. E. R. Swanston and W. E. Jupe, all R.E. despatch riders, "who have been motor cycling in France for a very considerable period, having all enlisted at the beginning of the war, have been granted commissions as second lieutenants in the R.E. Signal Service, after having successfully passed through a cadet course.

**MOTOR CYCLE RACING ON A GRASS TRACK IN HOLLAND.**

These photographs were taken on the occasion of a race meeting, the first of its kind, organised by the Motor Club "Noord-Holland." British machines performed very well, winning four events out of a total of five. Successful riders on Velocette (left) and James (right) are shown in the inset picture.

## A DOT DEVELOPMENT.

## DUPLEX FRAME; SADDLE ON LAMINATED SPRINGS.

**M**ESSRS. HARRY REED and Co., manufacturers of the well-known Dot motor cycle, have recently produced a new design of lightweight frame, the lines of which are clearly shown in our illustrations. It consists of a double framework of small gauge tubing, while the power unit, tank, etc., are carried between the two frames. The two sections are connected together at several points by small cross members, so that they form a rigid structure, and the design is of special advantage in that the frame members do not come in the way of any portion of the internal mechanism, so that any design of twin-cylinder engine can be fitted. Since the engine lies between the frame members, moreover, these members are subjected to no twisting stresses, the tubes being either in direct tension or compression.

The accompanying sketch illustrates the point clearly. A represents a single tube frame on which twisting stresses are imposed in the direction indicated by the arrows. The down tube tends to distort as shown in sketch. B represents a double frame on the lines of the Dot, but in this case the tube members are subjected only to direct tension and compression.

The makers claim that this new frame is very considerably stronger than the single frame, while it weighs only 2 lb. heavier.

In the case of a sidecar outfit a rigid framework is desirable for many reasons, but in dealing with a solo mount the weakness of a frame may lie in its very rigidity. An extremely rigid solo mount is often uncomfortable to ride, and in the old days of high-powered racing motor cycles it was found that when the heavy and powerful engines were mounted in very rigid frames, the frames invariably broke, whereas resilient frames stood up to the work.

## The Advantages of a Resilient Frame.

A correctly designed resilient frame is, therefore, superior in most respects to a rigid frame, and two light tube members are obviously more resilient than are heavy ones as regards absorbing

The new Dot lightweight with  $2\frac{1}{2}$  h.p. J.A.P. engine and duplex frame. The saddle is mounted on two laminated springs.

road shock. Thus, while the Dot frame would appear to be of good design as regards resisting intermediate twisting stresses, it affords a high degree of resiliency which adds to the comfort of the rider.

The makers claim that this frame possesses extraordinary shock absorbing qualities, and it will be observed that the saddle is mounted on two laminated

but it was found that the design fell short of mechanical perfection in that there was insufficient stiffness to maintain the vertical position of the rear wheel.

The transmission is inside the framework, and by a simple arrangement of shields attached to the frame members the whole of the mechanism can be enclosed.

Diagram showing the advantages of a duplex frame.

springs, which should impart a luxurious floating motion to the rider. The saddle position is extremely low.

The engineering mind may possibly criticise the two curved members extending from the rear wheel junction lug, pointing out that the design renders it possible to employ straight tube triangular construction throughout. The first frame built was of the latter order,

## A NEW BURBERRY COAT.

**B**URBERRYS have lately introduced a new coat which is quite ideal for the motor cyclist. In appearance it is exceedingly neat. It possesses the advantage of fastening up in a practically invisible manner at the left-hand side of the back, while the front is so designed

The new "Burfron" Burberry waterproof coat.

to form a conduit over which water flows away completely free of the legs. There are two buttons only, one at the collar and the other at the waist, while a belt is supplied—certainly a great asset when a motor cycle is ridden. Altogether we consider that the "Burfron," as the new coat is called, is quite a practical garment.

Valve side of the Dot duplex frame, showing how the engine is attached to the lower members. Note alternative saddle springing.

## Mr. A. A. Scott's Reply to a Criticism which is Typical of Many Received.

Undoubtedly, the introduction of the ingenious design of the Scott double-seated sidecar with its 5 h.p. two-cylinder two-stroke engine, three-speed gear, shaft-drive, and detachable wheels, marks a most important step toward the solution of the passenger motor cycle problem. Criticisms have on the whole been favourable, but many correspondents take a dislike to its appearance. The fitting of a fourth wheel is to them the obvious course. Consequently we invited Mr. Scott to expound his reasons for the adoption of a flat frame and three wheels in answer to such critics. A typical letter is appended:

To the Editor, "The Motor Cycle."

SIR,—The Scott sociable is horrible.

You say that its exclusive features will be studied with interest, that it possesses real novelty, and all this is true. The mechanical features are distinctly attractive, but the finished article has an extremely ugly and clumsy appearance.

It reminds one of the cycle cars which appeared at the motor cycle show a few years ago—when the alleged boom was on. Much could be said in favour of any one of them, but most of them have never been seen since, as no self-respecting person would make himself look ridiculous by riding in one.

The man who wants comfort and cleanliness *will* have a four-wheeler, but there is not one motorist in a thousand who will look at a lop-sided contraption like the Scott sociable, and I sincerely hope that no more atrocities like this will be perpetrated.

I speak merely as a private motorist (cycle and car) of ten years' experience.

S. L. BURNARD.

We submitted the above letter to Mr. Scott, and his reply is given hereunder:

### Mr. Scott's Reply.

Sir,—I welcome Mr. Burnard's letter, as it gives me the opportunity of answering this criticism scientifically.

First of all, let me say that at the outset and all along I have anticipated (and met many instances of) the fierce opposition of the man who wants a car on four wheels exactly like, and equipped with all the luxury of modern practice at the same price as, a modern motor bicycle and sidecar. This type of man despises anything but a car, and so I am quite unmoved by this outburst. I am *not* appealing to him, and never expected to interest him to any extent in my machine.

It was with *this* in mind that I strongly advised you to show a threequarter view from the "ugly side" of an ordinary standard motor bicycle and sidecar in contrast with the same view of my three-wheel combination, and ask your readers which is the more attractive in appearance? The conservative will, of course, have one reply; the analytical mind will differ. However, the Mr. Burnard type of man is of minor importance: even if he paid the price for what he wants his following is still a comparatively insignificant one. The output of the light car is only a fraction of the total production of four-wheel cars for *all* purposes. I note from the local returns that the registrations of motor bicycles exceed all the cars put together, so if I can succeed in interesting only one-tenth of this market—the *motor bicycle and sidecar*—at the same price, surely I am more usefully employed in thus attempting to meet the wants of the multitudinous motor cyclist rather than pandering to the select few by adding one more light car (at, say, £200) to the existing list.

I would analyse Mr. Burnard's letter as follows:

(1.) *The Scott Sociable is horrible.*  
The finished article has an extremely ugly and clumsy appearance.

Probably any motor bicycle and sidecar outfit is *horrible* from the standpoint of a car owner.

*Conservatism.* In 1900 I was repeatedly told that the Scott motor bicycle was quite the ugliest machine that had ever appeared. In 1916 I am frequently told that it has the most graceful appearance of any machine on the road. There is no permanence in unconsidered opinions of this sort.

*Ugliness.* Although the primitive mind has derived unending amusement from the unsymmetrical effect—the parti-coloured fool, for instance—beauty does not essentially depend upon symmetry. (The lop-sided effect of Amiens Cathedral towers is professionally admired.)

I prefer the frank disclaimer of the labourer who remarked, "I don't know much about them things, but seems to me t'wheel ought to be in t'middle."

*Clumsiness* is more a matter of movement than appearance. The machine was made for action, not merely to look at.

Hitherto, the man wanting comfort and cleanliness has had no other alternative. *If* he can get this at half the expense in first cost, taxation, and running costs, with the additional advantage of mobility, he is very likely to jump at the opportunity.

What I think is really intended by this statement is—the man who wants "swank" *will* have a four-wheeler.

Additional comfort and cleanliness can scarcely be gained merely by the addition of a fourth wheel—rather otherwise.

A reckless statement! Mr. Burnard should look before he leaps. There are, as a matter of fact, somewhere about ten motorists to every one Burnard—who are enjoying the looking at and riding of lop-sided contraptions of all sorts of frightfulness from the basket-work sidecar to the luxurious coach-built windscreened outfit.

*Why?* Mr. Burnard must every day see hundreds of lop-sided atrocities in the street, and they are constantly being perpetrated, and cannot be killed like the cycle car.

Is it because Mr. Burnard objects to any development which may put off the production of his four-wheel ideal? Why not realise that, in spite of his sincere hoping for the contrary, the motor bicycle and sidecar has done more than any four-wheel car to meet the wants of the many, and so is worthy of the fullest development and improvement.

If this extravagant letter had been written with some knowledge of the running of the machine—what it can do, etc., or criticising the principles of design—the remarks might be worth more attention. I am sure you will agree

(2.) The man who wants comfort and cleanliness *will* have a four-wheeler.

(3.) There is not one motorist in a thousand who will look at a lop-sided contraption like the Scott sociable.

(4.) I sincerely hope that no more atrocities like the Scott sociable will be perpetrated.

WHICH DO YOU PREFER? A Scott sociable and a typical sidecar, both viewed from the "ugly" side.

that it betrays an extremely uninformed point of view, formed entirely by appearances as viewed from the conventional standpoint.

However, I find from experience that, although I am not out for the car owners' approval, I can always make them change their views a bit after a trial trip.

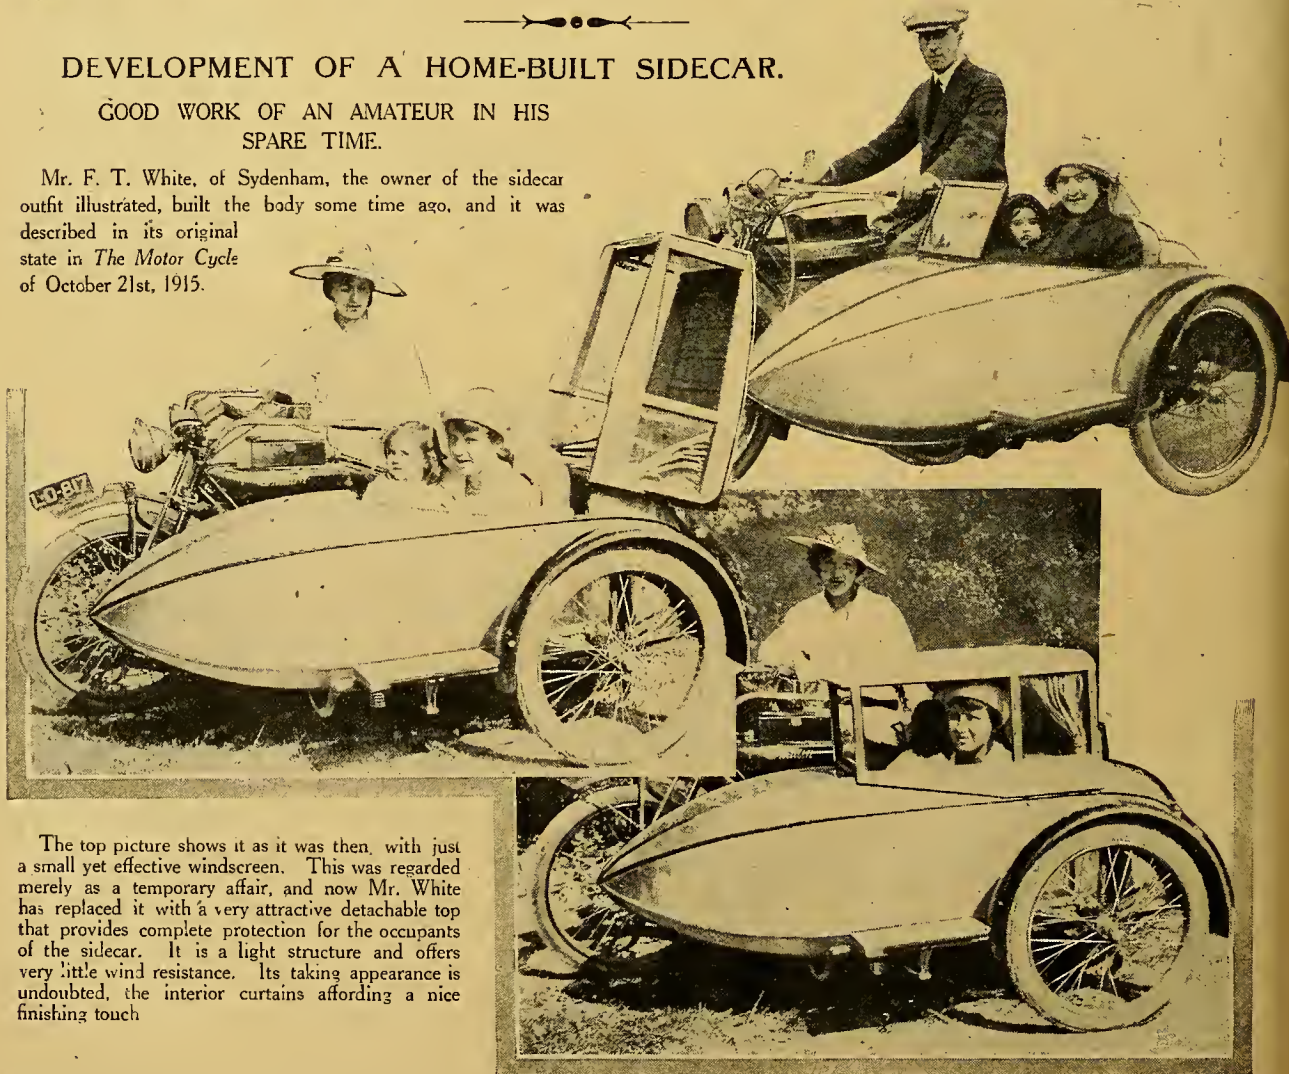

The *passenger inside cannot see*, and, consequently, *does not care* whether there is a fourth wheel or not, and the opinion of the people outside does not materially affect his comfort. It is the approval of the man with a motor cycle and sidecar that I want and hope to get.

ALFRED A. SCOTT.

## DEVELOPMENT OF A HOME-BUILT SIDECAR.

### GOOD WORK OF AN AMATEUR IN HIS SPARE TIME.

Mr. F. T. White, of Sydenham, the owner of the sidecar outfit illustrated, built the body some time ago, and it was described in its original state in *The Motor Cycle* of October 21st, 1915.

The top picture shows it as it was then, with just a small yet effective windscreen. This was regarded merely as a temporary affair, and now Mr. White has replaced it with a very attractive detachable top that provides complete protection for the occupants of the sidecar. It is a light structure and offers very little wind resistance. Its taking appearance is undoubted, the interior curtains affording a nice finishing touch.

## TYPES OF AVON TYRES—No. 4

## “Tricar”

THIS Cover is extremely popular for the driving wheels of medium-power solo machines, and as an “all-round” equipment for sidecar combinations up to 5-6 h.p.

“Tricar” Covers have a 4-ply casing, with two plies round the beads and a generous tread of best Avon rubber—notable for its extreme toughness and resiliency. With ordinary fortune and fair treatment, they are always good for splendid mileage.

The round-rubber-studded tread gets a good grip of the road, even under bad conditions, and is a great safeguard in cornering.

In answering this advertisement it is desirable to mention “The Motor Cycle.”

The  
High  
Service Qualities  
and  
Low  
Operating Costs  
of the  
**Ariel**

3½ h.p. Single-cylinder Model.

3½ h.p. Single-cylinder Combination.

The high service qualities of the Ariel have been demonstrated time after time in all the most important reliability trials of recent years, and confirmed by thousands of Ariel owners. Economy of operation is another strong Ariel feature, and includes :—

More miles per gallon of petrol.  
More miles per quart of lubricating oil.  
More miles per pair of tyres.  
More years of constant service.  
Fewer repairs and replacements.

**3½ h.p. and 5-6 h.p.**  
Countershaft 3-speed Gear Models.

## HOW TO ECONOMISE.

Another Contribution to our Series bearing upon the Fuel Question, containing Useful General Advice on Obtaining the Maximum Mileage from a Given Quantity of Spirit.

**E**CONOMY in petrol consumption, at all times desirable, and, since the rapid rise in prices, more or less vital, has now become absolutely compulsory to all, except the lucky few, whose requirements, being not more than two gallons per month, are to obtain all, or more than all, they asked. The average motor cyclist has now three courses open to him:

1. He may curtail his motoring by reaching his business on certain days by means of the railway or a push-cycle.
2. He may use one of the many substitutes now on the market either by itself or mixed with a certain amount of petrol, according to the extent to which his requirements exceed his supply.
3. He may so adjust his carburetter as to obtain an increased mileage per gallon, at the same time paying attention to those parts of the engine and cycle which have some effect upon easy running, and therefore upon consumption. In this connection it cannot be too strongly emphasised that perfect compression is absolutely necessary for the best consumption.

### Petrol Substitutes.

On the first of these points nothing further need be said, for each rider can judge for himself how far economy can be exercised in this direction. In some cases both train and push-cycle will be equally out of the question; in others one of these methods might entirely supersede the use of a motor cycle for the time being, but, of course, with a great sacrifice of time or money, or both.

It will be necessary, therefore, for most regular riders to turn to the second or third points. If a man's mileage is much in excess of that attainable on two gallons per month,

he must, of course, fall back upon substitutes. These can be obtained at varying prices, from paraffin at about 1s. per gallon to a prepared fuel which costs more than petrol.

### Cheap Fuels the only Alternative.

Every careful reader knows that *The Motor Cycle* has devoted much space, especially during the last few months, to experi-

A simple device to assist in breaking up the petrol spray fitted to an Amac carburetter.

ences and tests of the cheaper fuels, paraffin-petrol mixtures, etc. There is, of course, nothing new in the use of paraffin. The writer used a mixture upwards of ten years ago in a machine fitted with a Longuemare carburetter with quite satisfactory results, and later on a small twin with a Motosacoche carburetter. Hill-climbing was certainly improved on this machine, which is contrary to the usual experience when using paraffin. (This was referred to in a leading article on July 31st, 1913.) But paraffin is messy. The white oils and other substitutes are probably much cleaner than paraffin, both inside the engine and outside the machine.

### Carburetter Adjustment.

If, however, a rider can accomplish almost his required mileage on his allotment of petrol it is possible that careful carburetter adjustment may give him the extra miles that he requires. Generally speaking, a small jet increases the mileage, but a smaller jet usually necessitates a correspondingly smaller choke. A No. 24 jet recently fitted to an Amac carburetter in place of a No. 26 gave an increase of 17 m.p.g., viz., from 98 to 115, the machine being used under the same conditions throughout. The running of the engine is not so pleasant, and the air lever requires more frequent manipulation, but the power is more than sufficient for present requirements, and the speed ample.

Lowering the petrol level also tends to economy, but this must not be overdone. In general, if the petrol is about an eighth of an

inch below the top of the jet the results will be good, but this does not apply to every carburetter. For instance, the level in a Senspray can be much lower, and an Amac must not be tested with the working jet in position (for the normal level is above this, as is also the case with some of the automatic carburetters), but with the special testing jet supplied with every carburetter.

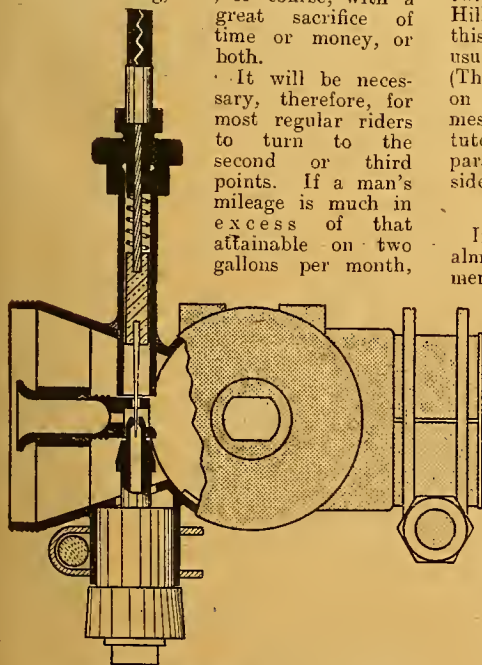

The B. and B. Universal is a handy carburetter on which to carry out experiments in jet size, and very economical results can be obtained. 160 m.p.g. has been covered with a B. and B. fitted to a 2½ h.p. twin, but the reserve of power was not great. The jet can, however, be operated from the saddle.

### Useful Tips.

Many useful dodges and hints have been given from time to time in the pages of *The Motor Cycle*. On April 6th last Mr. J. W. G. Brooker advised that the spraying holes in an Amac should be enlarged and pins inserted, with the object of breaking up the petrol spray more completely. This effected an improvement in consumption of about 25 m.p.g. The writer of a letter in last week's issue improved his consumption by 18 m.p.g. by the same means. On January 15th, 1916, a method of making the jet of a Senspray variable is described; this, it is claimed, improved the consumption of a two-stroke from 60 to 120 m.p.g. It is to be presumed, however, that the original jet, while it gave easy starting, was much larger than it need have been.

A method of supplying hot air above the jet of a Senspray carburetter.

A variable jet controlled from the handle-bar applied to a Senspray carburetter.

### How to Economise.—

When using a heavy fuel it is desirable to decrease the size of the jet, and also to fit a gauze or some device which will assist in the vaporisation of the fuel. We know of one rider who has used paraffin most successfully for four months, and he advises a piece of flannelette to be placed across the inlet pipe to assist in vaporising the fuel,

Linen bag covering carburettor to prevent ingress of dirt and grit, and also collecting any fuel which may drip.

while he also states that a little lubricating oil mixed with the fuel prevents any risk of damage through impoverished lubricating oil. An extension pipe fitted to the air inlet is also an aid to economy, especially when it is so arranged as to convey warm air from the neighbourhood of the cylinder flanges. A pilot jet or by-pass, too, can be fitted with advantage when a carburettor is not already provided with such a device.

The chief difficulty which will be experienced by the rider when utilising one of the heavy fuel substitutes will be the difficulty in starting from cold. Many machines will give equally good results on the heavy fuels, and in some instances

Bottom feed float chamber and jet. The level can be varied by moving the collar up to lower the level and down to raise it.

better results are obtained than on petrol once the engine has been started and the cylinders warmed up. Even when a 50% mixture of fuel and petrol is used there may be a certain difficulty in obtaining the initial explosions. If undiluted white oil or paraffin is to be the petrol substitute, some provision must be made to effect a start, and the simplest method is to run on petrol until the engine has gained enough heat to enable it to vaporise the paraffin sufficiently. There are several ways of ensuring a supply of petrol for starting. The simplest is to carry a large oilcan. An ordinary liberal injection of petrol given through the compression taps will, in fairly warm weather, render starting quite normal. A more elaborate method is to have a small auxiliary tank for pure petrol and a two-way tap and twin feed pipe to the carburettor. Thus petrol is fed for starting, and when warm this can be turned off and the paraffin or heavy fuel turned on.

The chief objection to this method is that unless the heavy fuel tap has been turned off previous to stopping, so that the contents of the carburettor float chamber are thus exhausted, difficulty will arise when the next start is required, owing

to the presence of heavy fuel. This can, of course, be overcome by fitting a tap in the lowest point of the heavy fuel supply pipe, so that any fuel remaining may be drained away. This is a somewhat wasteful method. There is, moreover, a slight liability of an air lock being formed. A method recently adopted by the writer and found most satisfactory is to lead a small bore pipe from the auxiliary petrol tank to a tap fitted into the induction pipe. When a start from cold is desired the paraffin or heavy fuel is turned on in the ordinary way, the carburettor throttle shut, the compression tap in the induction pipe opened, and the tap from the auxiliary tank turned on, so that a very small supply of petrol is dripped into the induction pipe. By experiment it will be found which is the correct amount to be turned on to give satisfactory starting and running until the engine is warm enough to allow the throttle to be opened

To adjust the petrol level in a top feed carburettor all that is necessary is to move the small shoulder on the needle, up to raise the level and down to lower it. The correct position for the petrol is about  $\frac{1}{16}$  in. from the top of the jet.

and the running continued on the heavy fuel.

When using heavy fuels, particularly paraffin, we repeat the advice given in the leading article in our last

Autovac petrol economiser. It is fitted over the jet, and is so made to create a partial vacuum at the top of the nozzle. Below the vacuum cone a fine gauze net retains and vaporises any surplus petrol, and checks wastage caused by "blow back."

issue, to drain the crank case more frequently, say every 150 to 200 miles. This is a precautionary measure to prevent paraffin which may not have been vaporised from leaking past the piston and so diluting the oil in the base

A simple variable jet constructed from an ordinary domestic sewing needle. The control is by means of a milled screw cap. Undoubtedly such an arrangement as this would ensure economy, at the same time enabling full power when necessary.

**How to Economise.—**

chamber, to the detriment of the bearings. Another tip was to use slightly thicker oil than that normally employed.

One occasionally hears a motor cyclist asserting that his machine is most wasteful of petrol, and quoting some ridiculous figure such as thirty miles to the gallon. One thing is certain, that the engine is not consuming petrol at this rate. The abnormal consumption is due mainly to wastage. Waste of petrol can occur unknown to the rider at many different points. For instance, the petrol tap under the tank is a frequent source of leakage, especially on old types of machines. Likewise the union under the float chamber. The needle valve, too,

after continual use, fails to cut off the supply of petrol when the action of the buoyant float brings the weights into operation, with the result that the float chamber overflows and the spirit runs down the sides of the float chamber, as well as dripping from the base of the spray chamber, and is lost.

It will be gathered that these troubles will occur when the machine is standing as well as when it is running if the rider fails to turn off the petrol supply tap. To check whether the needle valve point is a good fit in its cone seating, remove the top of the float chamber, put the needle in position, and turn on the petrol tap. If the needle is a sufficiently good fit to prevent more petrol

entering the float chamber, all is well. To test the level in the jet, remove the top portion of the spray chamber exposing the jet, and turn on the petrol tap. If the petrol rushes over the top of the jet, the level is too high, and the test has proved that this is occurring practically all the time the machine is running. In testing the level of the petrol, it is better to fit a dummy jet, i.e., one with an open top, so that the level to which the petrol rises may easily be ascertained. Before coming to a standstill, turn the petrol tap off, and so drain the float chamber and pipe. This economical method has the added advantage of ensuring a supply of fresh spirit when a restart has to be effected.

**AN IMPROVEMENT IN SIDECAR LUGGAGE CARRIERS.**

A spring luggage carrier for sidecars.

**T**HE luggage carrier which is attached to the back of a sidecar is generally attached to the chassis, and is consequently unsprung. This, of course, subjects the contents to much vibration, and those sidecarists who have to carry any luggage of a delicate nature will welcome any attempt to improve this state of things. We illustrate herewith an excellent sprung carrier, the invention of Sir Arthur Trevor Dawson, George Thomas Buckham (both of Vickers, Ltd.), and Frank Smith (of the Clyno Engineering Co.), No. 10,683/1915.

In this construction the carrier is

supported on two cantilever springs which are attached to the back of the chassis. To prevent the carrier from rolling, it is fastened by two movable arms to a rocker bar. The rocking arms and the rear arms of the cantilever springs are proportional in length to give a slight rocking movement to the carrier; that is to say, the carrier does not have a parallel motion in side elevation, though prevented from rolling. The dotted parts show part of a spring, etc., placed in an alternative position, the front end, which would then be attached to the sidecar frame.

**PETROL PERMITS NOT TRANSFERABLE.**

**A**N interesting point in connection with the new petrol licences has been raised by a correspondent, who is borrowing a sidecar outfit from a friend for the purpose of taking a week's tour. He is anxious to know if, in addition to borrowing the machine, he can also borrow his friend's petrol card in order that he may obtain *en route* petrol to the quantity stated on the card.

We have approached the Petrol Committee on this point so as to obtain a definite ruling, and they inform us that the petrol licences are not transferable. Therefore it is not possible for anyone possessing a petrol card to allow another person to purchase the fuel.

On first thoughts there would seem to be no objection to such a procedure, as the petrol card is only available for a certain quantity of spirit, and no one will be able to purchase more than the stated quantity within the specified period, and

therefore this would not lead to a greater usage of the fuel. As the shortage of petrol in the country is the alleged reason for the necessity of curtailing motoring to as great an extent as possible, the Petrol Committee evidently think that if the owner of a petrol licence does not desire to use the amount of spirit to which he is entitled, this quantity should not be utilised by anyone else, but should be held in reserve for subsequent allotment. According to the figures published in our last issue the Petrol Committee have issued licences for more petrol than is available, and therefore, it would seem the Committee do not want all owners of petrol cards to purchase the whole amount to which they are entitled. Naturally, if everyone were to do so there would be no petrol to be purchased towards the end of the time limit for the petrol cards at present in use, unless the available quantity should increase.

### Average Prices OF Second-hand Machines.

**W**E give below the average prices of second-hand motor cycles offered for sale in *The Motor Cycle* dated August 10th, 1916. Where it is possible to obtain a sufficient number of each model the average for the past week is quoted, otherwise the last average that appeared is given, if within a period of four weeks.

Make.	Year.	H.P.	Average for last week.	Latest average obtainable.
A.J.S.	1914 6	3-sp. sidecar	£65	—

# "THE MOTOR CYCLE" RECRUITING SECTION.

Twenty-six M.M.G.S. Recruits Last Week.

THERE are still vacancies in the Motor Machine Gun Service for experienced motor cyclists and car drivers able to execute ordinary running repairs.

Inspections of recruits were held at the Coventry Recruiting Office on Tuesday, and at the offices of *The Motor Cycle*, 20, Tudor Street, London, E.C., on Saturday last. The names of those motor cyclists and car drivers accepted are given below.

Attfield, F., Aldershot.  
Beaumont, T. W., Dawbury.  
Belton, P. J., Aldershot.  
Brown, G. L., Birmingham.  
Chambers, H. H., Derby.  
Darlington, H. W., London.  
Eyles, T. O. N., Wimbledon.  
Fallaise, P., London.  
Gipson, F., Chatteris.  
Hollis, A. W., Oxford.  
Hore, G. W., London.  
Huggett, T. W., Horley.  
Isaac, J. C., Liskeard.  
Jobson, C. W., Beverley.  
Low, F., Harborne, Birmingham.  
Mattocks, B., Aldershot.  
Norgrove, G., Smethwick.  
Reuleaux, G., London.  
Robinson, W. H., Whitechurch (Salop).  
Root, O. W., London.  
Smith P., West Meon, Hants.  
Stevens, P. E., London.  
Williams, A. C., Penarth.  
Windsor, H. B., Reading.  
Woodhead, F., West Hartlepool.  
Woodward, F. W., Market Harborough.

## Central Office for Motor Machine Gun Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

Arrangements had also been made for a further group of candidates to attend at the Coventry Recruiting Office on Tuesday of this week. The two next dates arranged are:

MANCHESTER.—Messrs. Iliffe and Sons Ltd., Century Buildings, Deansgate, WEDNESDAY, August 23rd, 2.15 p.m.

COVENTRY.—The Recruiting Office, Little Park Street, TUESDAY, August 29th, 2.30 p.m.

Full particulars of enlistment and a form for filling in purposes may be obtained on application, whilst the conditions of enlistment are mentioned on this page. Prospective recruits conforming to requirements, and who are ready to join up at once, may attend any of the inspections announced on this page.

A free railway warrant will be issued to prospective recruits living at a distance, if the applicant will previously get examined before the Medical Board for his district.

The amended conditions of enlistment in the Motor Machine Gun Service are given hereunder:

EXPERIENCE.—At least one year's motor cycle or car driving experience.

AGE.—18 to 40.

ENLISTMENT.—For duration of the war.

MEDICALLY FIT.—For general service, or for garrison duty abroad.

PAY.—1s. 2½d. per day, all found; the usual separation or dependant's allowance.

In London on Saturday one of the applicants was M. Gaston Reuleaux, a French-Belgian, who has served eight months as a civilian chauffeur attached to the Belgian Army. He is at present chauffeur to the Regent of Persia, H.H. Nassereul Moalk. M. Reuleaux is anxious to be attached as a motor driver to the Royal Flying Corps or the Motor Machine Gun Service; he speaks French, English, a little Flemish, Dutch, and German.

R.F.C. MOTOR CYCLISTS IN THE PUNJAB.

(Left) Cpl. Neal, driving, leaving Risalpur for Nowshera.

(Right) A tunnel through the hills on the way to Malakand.

## MILITARY MOTOR CYCLES IN INDIA.

IN *The Motor Cycle* of January 20th last we gave the impressions of motor cycling in India gained by a corporal with a mechanical transport unit. A few days ago we had a letter from an A.S.C., M.T., officer with the same section that throws some light on the difficulties military motor cyclists have to contend with in parts of India. Though mainly concerned with cars, our correspondent, Lt. E. C. Abbott-Young, has seven motor cycles to look after, i.e., four Triumphs, two New Hudsons, and one Abingdon King Dick. By far the greater part of

the work appears to fall on the Triumphs, which stand up remarkably well.

Dust appears to be the great trouble in the North-west Frontier Province. It is really terrible at times, and the chief casualties among the two-wheelers are due to dry skids in the dust. Our correspondent recently rode along a road which was nine inches deep in dust, and says, "Over and above the noise of the exhaust I could hear the dust falling in solid sheets, and it sounded like going through a watersplash."

W. H. Elce, of Messrs. W. H. Elce and Co., has joined the R.E. despatch riders as an artificer. He was examined

by the Editor of this journal. The firm will continue to do business from their premises in Bishopsgate Avenue, E.C.

L.-Cpl. L. C. Tizzard, Somerset L.I., who has been awarded the Military Medal, is a Douglas employee. Already three other old Douglas men have been similarly honoured.

Capt. T. Henderson-Begg, Gordon Highlanders (T.F.), who, we regret to state, was killed on July 23rd, was a keen motor cyclist and well-known in Scottish motor cycling circles as a Rudge exponent. He was only recently married.

# The Design of Motor Cycle Steering Heads.

## SOUND SCHEMES SUGGESTED BY EXPERIENCE.

The subject of steering head design was touched upon in our pages some weeks ago by a writer from the Front. On August 10th we published an article dealing with the question, and, in view of its importance, give some further very practical remarks below. These are from the pen of a M.M.G.S. sergeant whose wide experience gives him the right to speak authoritatively.

**P**ROBABLY most men who have had to keep motor cycles in order have noticed how often the steering heads need adjusting. This necessity for frequent adjustment is very noticeable with most heavy sidecar machines, and in the case of the very heavy gun machines used in the M.M.G.S. the adjustment of the steering head or the renewal of the races is so frequent a necessity that if a dozen machines were picked out haphazard on the road, probably not more than one or two would be found to be in a satisfactory condition in this respect.

This very undesirable state of affairs leads one to suspect something faulty in the design, but it should not have been necessary to wait until unsatisfactory performance forced this point on our attention. To anyone possessing mechanical insight, the conventional arrangement of the bearings in steering heads appears obviously wrong almost at the first glance.

In the following article the forces acting on the steering head of a motor cycle are analysed, the type of ball bearing commonly used is shown to be unsuitable for carrying these forces, and two designs with bearings suited to the forces acting on them are illustrated.

Fig. 1 is a diagrammatic drawing of a common type of steering head, fitted with two thrust bearings, one at the top and one at the bottom in the usual manner. Suppose  $R$  is the upward reaction of the ground on the front tyre. For all practical purposes this will act vertically upwards through the centre of the wheel. Imagine this reaction divided into two components, one along the axis of the steering column and one at right angles to it. This can be done by the parallelogram of forces shown inset.

From this it will be seen that, if the steering head inclines  $30^\circ$  from the vertical, the reaction  $R$  is equivalent to a thrust of  $.86 R$  acting along the steering column and a force of  $\frac{1}{2} R$  acting at the point  $O$  at right angles to the column. The thrust  $.86 R$  is carried quite simply by the lower thrust ring, but in the design shown there is absolutely no provision made for carrying the force of  $\frac{1}{2} R$  at right angles to the column.

This force produces two reactions  $P$  and  $Q$  at right angles to the steering column. The magnitude of  $P$  may be calculated from:

$$P \times 5\frac{1}{2} = \frac{1}{2} R \times 25 \text{ (on the see-saw principle).}$$

$$\text{Therefore } P = 2.27 R.$$

The force  $Q$  is equal to the sum of  $\frac{1}{2} R$  and  $P$ , therefore  $Q = 2.77 R$ . It will thus be seen that the force  $Q$  acting sideways on the lower thrust bearing is more than *three times* the thrust of  $.86 R$ , yet the bearing is designed to carry a thrust and not a sideways force.

Due to the reaction  $R$  there is no thrust on the upper bearing, the whole force being the sideways force  $P$ . It might be noted here that the existence of these sideways forces is very apparent (though not more real) in the case of the Triumph and the Clyno M.M.G.S. machines, where heavy springs are fitted to carry the very considerable forces at right angles to the steering column.

### Two Suggested Designs.

What, then, are the possibilities of designing a steering head in which the relatively large forces at right angles to the column are provided for as well as the thrust?

Two designs are shown in figs. 2 and 3. In fig. 2 a journal bearing is first placed on the steering pillar, then a thrust bearing on top. In the upper end of the steering head is placed first a thrust bearing and then a journal bearing. In this design the lower thrust bearing carries the thrust  $.86 R$  and *nothing else*. The upper and lower journal bearings carry respectively the forces  $P$  and  $Q$  and *no thrust*. The possibility of thrust on the journal bearings is eliminated by leaving the outer races free to slide in the steering head.

Fig. 3 shows a design in which bearings capable of carrying both thrust and sideways force are used. This design, the writer believes, is actually in use in a few machines, but there is no harm in drawing attention to it and noting its great superiority over the type, as shown in fig. 1. The writer rode a pedal cycle many years ago in which the steering head was designed in this way.—J. H. SINCLAIR, Sgt., M.M.G.S.

### S.O.S.

A correspondent writes: "Will you kindly inform me if it is possible for a two-cylinder engine to be a four-stroke?"

### The National Relief Funds.

At the week-end the principal war funds stood as follow:

The Prince of Wales's National Relief Fund (£3,443,250 distributed)	...	£5,942,159	0	0
British Red Cross Fund	...	4,174,842	0	0
Tobacco Fund	...	111,892	17	0

### An Australian Club's Record.

The Victorian Motor Cycle Club's eleventh annual report was issued at the end of May. The present membership is 215, and sixty-eight members are in one or other of the Services. As a result of the 200 miles road race, reported in *The Motor Cycle* of June 22nd, the Red Cross Society benefited by over £100.

### No Changing of Petrol Permits.

Last week a motor cyclist, who had not received his petrol licence and had an important journey to make, borrowed a friend's permit on the promise to return the compliment at a later date. A query on the same subject having reached us, we sought an official ruling, and the Petrol Control Committee of the Board of Trade denounces the practice!

### Nursing the Overseas Trade.

We understand that the Durban, Natal, Rudge agents have been able to get a shipment of 1916 Rudges, War Office permission having been obtained by the manufacturers. Messrs. Buttery and Hatton, the firm in question, received the machines last month, and they are the first for a period of twenty months! We understand that there is a scramble for them in Natal.

### Mail Delivery by Motor Cycle.

An important law has recently been passed by the U.S.A. Congress permitting the use of motor bicycles by rural mail carriers. Previously only side-carriers were allowed by the Postmaster-General for this class of work, but the new law allows of the use of any type of motor vehicle, provided the work is carried out satisfactorily. The passage of this law means for U.S.A. motor cycle firms, it is stated, a market for from 5,000 to 10,000 additional motor cycles during the next twelve months.

### Utility of Motor Cycles recognised by New Zealanders.

According to Mr. J. B. Clarkson, the well-known motor trader of Wellington, N.Z., three out of every five motor cycles sold in New Zealand are used for business purposes. They are not necessarily attached to sidecarriers, but the owners, being people who find it necessary to cover considerable ground in performing their duties, use their machines in the course of their work. This was the important point made by Mr. Clarkson in an interview with a representative of our New York contemporary, *Motor Cycle Illustrated*.

### Arbuthnot Trophy Fund over £100.

The following donations have been received up to the time of going to press for the above fund, which was organised in order to perpetuate the memory of Rear Admiral Sir R. K. Arbuthnot, who, it will be remembered, was killed on H.M.S. *Defence*, in the great Jutland naval battle. The trophy is to take the form of a statuette of the Admiral, and is to be competed for in an annual motor cycle competition, open only to naval officers. Donations should be sent to the A.C.U., 83, Pall Mall, S.W.

### Australian Auto Cops.

The Sydney police force is to be augmented by a motor cycle corps for "scouting duty the suburbs."

### Price of Petrol in Western Australia.

Users of petrol in Western Australia are now paying 3s. 3d. per gallon, so that it is as expensive as here, though, so far as we are aware, there is no real shortage in that part of the world.

### A Mysterious Noise?

*The Motor Cycle and Cycle Trader* tell a story of a novice who took his machine back to the agent, riding it very slowly and carefully, because a "mysterious and rather alarming noise" had suddenly commenced. This noise was caused by the stand, which had become unfixed, bumping along the road.

### Postponed Petrol Permits.

The Petrol Committee is at present dealing with the cases of munition firms and others whose work is of national importance. They may receive an additional allotment when circumstances warrant such a concession. This news will bring relief to "Scottish Road Surveyor" (see Summary of Correspondence and others. No less than 24,000 motorists were late in making their returns; the applications were put on one side for a time, but are now being considered.

### Petrol Substitutes.

One of the most popular substitutes at present is White Oil, which is obtainable in many garages throughout the country. Mr. H. Taylor, whose firm sells it at 2s. per gallon, tells us that tests prove it to give very satisfactory results with a 25% mixture of petrol. No injection of petrol is necessary.

### Bodinnick Ferry.

The ferry from Fowey to Bodinnick has recently been made suitable for motor traffic. Previously the ferry consisted of a small boat and the approaches were very bad. The descent is still deep, being about 1 in 7 on the Bodinnick side and 1 in 7 on the Fowey side, but the surface now consists of granite sets. The new ferry boat is capable of carrying two cars at a time. Fowey may now be approached from the east, as well as via Loswithiel and Par, and the roads to Looe, Polperro, and Liskeard are much shortened. This ferry is one of the two which cross the river, or rather estuary, at Fowey, the second being nearer the sea at Polruan, but until recently neither was suitable for motor traffic.

CANADIAN MOTOR

Douglas mounted motor cyclists attached to a Div. Sig. Coy. of a Canadian Division. King, Perkins, Thomson, McKay (Art.), Jacobs, Harrison, Norris, Van Antwerp, Fanes, of a sergeant; formerly a lieutenant was in charge.

ended at Mons.

Among the British prisoners of war sent to Germany to Switzerland last week-end Lieut. C. E. Wallis, 1st L. North Lincs., at the outbreak of war was advertising for our sister journal *The Light Car*. He was taken prisoner quite early in the war, and he was wounded.

3-valve Indian on the Market.

The 1916 catalogue of Williams, Hunt, and South African agents for the Hendee Manufacturing Co., includes the eight-valve machine as being imported to special order only. The price is £102 10s. This is interesting, as, though this model has been used in many parts of America and Europe, it is the first time it has been placed on the market. The South African prices for Indians appear to be more than those for the same machines in England. Thus the three-speed Powerplus is £12 10s. in South Africa and £90 in England; the lightweight £55 in South Africa and £49 10s. in England.

Motor Fuels.

Another petrol substitute has been put on the market, and we give herewith details concerning it. It is made in three qualities. No. 1 has a specific gravity of 75-750, with a flash point of 75, and is at the price of 2s. 6d. per gallon; No. 2 has a specific gravity of 770, and a flash point of 80, the price being 2s. 3d. per gallon; No. 3 has a specific gravity of 785 and a flash point of 83, the price being 1s. 9d. per gallon. Known as the Triple fuel it is sold by the British-American Oil Syndicate, 1, Marlborough Street, W.

Still another new fuel is called the Magic, marketed by Symons Motor Works, Blackheath, near Bromsgrove. It is said to give excellent results as to power, and though it takes rather more deposit than petrol, this is easily and easily removed. The price is 3s. per gallon, and it can be supplied in drums.

Coventry Premier Light Car.

Many motor cyclists will be interested in a description of a Coventry Premier light car published in yesterday's issue of our journal, *The Light Car*. With the exception of a small two-cylinder four-cylinder, the name Coventry Premier has hitherto been associated with bicycles and motor bicycles. The new car is quite a light machine.

No Petrol Permits.

Complaints continue to reach us from readers who have made their application for an allowance of petrol, but so far have received none. The only advice that we can give is that they should possess their souls in patience, and write again to the Petrol Committee, 19, Berkeley Street, London.

Petrol for Special Constables.

A fortnight ago we announced that motor cyclists are wanted for the H.Q.C.D. It should be understood that though petrol for the work, which consists in being on duty during night raids, is provided, it has to be paid for; in fact, members of this A.A. Section of the Headquarters Central Detachment find everything themselves. Those willing to help should write Mr. Bartleet, A.A. and M.U., Fanum House, Whitcomb Street, London, W., who will willingly supply full particulars.

Motor Sections and the Training Reserve.

It is not yet known officially how recruiting for the different motor sections will be affected by the organisation of the Training Reserve, the formation of which was authorised in Army Order 259 issued last week. Briefly, the Training Reserve will serve as a general pool from which drafts can be found for any regiment which cannot obtain all the men it requires from its own regimental reserves. In the past, when a regiment required reserves, it was necessary to transfer men from another regiment which had a surplus. This method was not popular.

If the new Army Council instructions on the organisation of the Training Reserve are applied to the motor sections, it would mean that men able to drive motor cycles or motor cars would be put into a general pool on their reporting for active service, and the different motor sections requiring recruits would draw upon them as necessity arose. At the present time there are dozens of examining officers scattered about the country examining recruits for the different motor sections, A.S.C., R.E., and R.F.C., but the number of recruits of late, in consequence of the last groups having been called up, has naturally fallen considerably.

SPECIAL FEATURES.

HOW TO ECONOMISE (illus.).  
STEERING HEAD DESIGN (illus.).  
A DOT DEVELOPMENT (illus.).

Proposal to Boycott German Goods.

In a letter in the current issue "Britisher" suggests the formation of a league of motor cyclists pledged to refuse to accept German goods of any kind both now and after the war.

AWARDED THE ALBERT MEDAL FOR GALLANTRY.

Lieut. S. A. Rowlandson, who a few months ago led a party of men into a burning building where there lay an unexploded German shell; they carried the shell out and extinguished the fire. The many motor cyclists, both trade and amateur, to whom he is known will join us in offering our heartiest congratulations.

Economy in a Nutshell.

Those motor cyclists who are anxious to economise, or who may be using one of the dozen or so substitutes for petrol will find the article in the present issue entitled "How to Economise" of considerable assistance. The hints and tips incorporated in the article are the result of prolonged riding experience. The wise rider will keep the article by him for reference purposes.

Motor Cyclist Airmen.

We have frequently referred to the number of motor cyclists in the Royal Flying Corps, and the excellent training school for such a section that the motor cycle has proved. Some motor cyclists have enjoyed rapid promotion, such as A. Mackenzie Cott, the owner of Big Ben, now a captain and equipment officer; also H. Lister Cooper, the Triumph rider, J. W. Woodhouse, the Precision engine expert, of Birmingham, and A. M. C. Scott, formerly with Premiers, who have all gained their captaincy. There are, of course, many other motor cyclist officers in the flying section, and many, too, anxious to gain admittance.

DESPATCH RIDERS.

To right: Lt. Steele, Sgt. Taylor, Cpls. Tarrigan, Dickson, MacDonald, Hooper, Score. It may be mentioned that sections of British despatch riders are now placed in charge

### A NOVEL CHAIN GRIP.

THE motor cyclist making chain adjustments often wishes that he possessed a third hand; some small tool for temporarily holding the ends of the chain in position is almost a necessity. There are several devices for this purpose now on the market, and another very simple tool comes from an American source. It consists of a piece of steel wire formed with a coil in the centre, the ends being made to fit between the rollers. All that is necessary to use it is to cross the ends and insert them in the chain ends. Both hands are then free to work.

A novel chain grip.

### THE EMPIRE PETROL ECONOMISER.

TO motor cyclists who feel that their engines would stand more air the Empire automatic petrol economiser should prove a particularly useful fitment. It consists of an air valve which opens as the suction of the engine increases, and so weakens the mixture, thus producing greater economy. It is also useful on descending a hill, as the throttle may be closed, and if the economiser is placed between the throttle and the engine the vacuum in the induction pipe will cause the valve to open and permit cold air to be drawn in, thus cooling the engine. And since it destroys the vacuum in the combustion chamber, it will prevent oil being drawn up past the piston rings above the piston, which is a common cause of excessive carbonisation.

The device consists of a gun-metal body, a threaded spindle, a spring, a mushroom headed sleeve, which carries a leather washer, which is free to slide on the long extension of the spindle, and a cap, which is drilled

Part sectional view of the Empire petrol economiser.

with holes. The elbow, which forms part of the body, is screwed into the induction pipe, care being taken to make an air-tight joint. The partial vacuum in the induction pipe, caused by the downward movement of the piston on the induction stroke, causes the washer to rise from its seating and admit cool air into the induction pipe, thus reducing the richness of the mixture coming from the carburetter. By means of the adjusting screw the pressure on the spring can be increased or decreased at will. The device is well finished, and certainly should tend towards economy, which is so necessary at the present time.

### A NOVELTY FROM AUSTRALIA.

EVIDENTLY our motor cycle cousins "down under" suffer considerable discomfort on their very bad road surfaces. Our own English roads are bad enough, but they are smooth compared to the average road in Australia.

With the idea of minimising, if not entirely eliminating, handle-bar shocks,

The MacLean handle-bar spring.

Mr. Percy MacLean, of Hamilton, New South Wales, has invented a curious looking device, which is to act as an insulator between the handle-bars and the frame.

From the illustration it will be seen to consist of two powerful graduated springs, a series of arms, and no fewer than seven pivots. The thinner parts of the springs take the small vibrations, the thicker parts coming into action to absorb the larger shocks.

Our contemporary, *The Motor of Australia*, speaks very highly, not to say amusingly, of this invention, describing it as "an appliance that makes the holding of the handle-bars of a motor cycle as easy as stroking the hand of one's best girl." Neither article being at hand we have no means of verifying this statement. A terrible picture is drawn of the woes of motor cyclists in the Commonwealth due to bad roads—health is sadly impaired, heart strain and digestive troubles being the direct outcome of "clinging for dear life to the handles to prevent them being shaken from one's grasp."

Making due allowance for journalistic eulogies, it is certain that the invention is reasonable and effective, and should

go far to eliminate discomfort. It has been patented throughout the world, and is now being manufactured by the Twentieth Century Engineering Co., of Sydney, N.S.W.

### TWO NEW APOLLO PLUGS.

WE have received two sample Apollo plugs from Messrs. Brown Bros., Ltd., 15, Newman Street, W. The plugs are made of mica on a novel principle. Brand A1 is an all-mica plug, the central electrode of which is first of all wrapped up with a sufficient number of layers of mica to withstand an electric pressure of 80,000 volts. After this has been securely fixed mica washers are compressed on the whole length of the wrapping, and these are then turned in the lathe to the necessary dimensions. The next process is to compress the outside mica washers over the cone. The whole is then secured by mechanical means that entirely obviate any possibility of the washers coming loose. They are afterwards rendered waterproof by impregnation with a special compound. In the Apollo plug, the makers claim that all the difficulties with reference to the manufacture of a satisfactory mica plug have been overcome.

The other model is Brand S, which we illustrate. This consists of a porcelain

The Apollo mica and porcelain plug.

Parts of the Apollo mica and porcelain plug.

cap surrounding the mica wrapping on the centre electrode. A copper washer is inserted between the body of the plug and the porcelain. The external electrodes are substantial, and the plugs look as if they will be highly suitable for motor cycle work.

A new branch of the Firestone Tyre and Rubber Co., Ltd., has been opened at 2a, Atkinson Street, Deansgate, Manchester.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

### Magneto Contact Breaker.

**?** Why does the rocking lever of a magneto work in a fibre-bushed hole? It is not to insulate it, because the other platinum is carried by an insulated block which is connected to the condenser by the central screw, and the current must flow across the points to earth, the path being provided by the spring.—J.I.H.

Fibre is not used in this case as an insulating medium, but simply because it is the most suitable substance for this bearing, as it does not require lubrication.

### Pre-ignition.

**?** My mount is a single-cylinder 2½ h.p. machine, not out of the shops above a month. On one particular road, an incline 1 in 45 for one and a half miles (preceded by a steep hill of half a mile), I find that towards the end of the gradient my machine stops dead, and it means a rest for a minute or two before I can start again. I use top gear, with the throttle sufficiently open not to choke, air control threequarters open, E.I.C. ignition fully advanced. Can you explain the trouble and tell me how to remedy it? I have been travelling as fast as 30 m.p.h. when the engine has suddenly stopped.—H.J.C.

We should say the trouble is caused by pre-ignition, due to your using a plug the points of which project too far into the cylinder. Use a good single point plug, and we think the trouble will cease. The piston rings being gummed up with carbon deposit might also cause the trouble. If possible use a smaller jet; this may cause the engine to run rather cooler.

### Fitting a Single-lever Carburetter.

**?** (1.) Would there be any objection to fitting a single lever to a 6 h.p. twin? Do single lever carburetters give the same power, flexibility, and slow running as the two-lever type? How does their petrol consumption compare with this type? (2.) Is a 6 h.p. too large for solo riding? (3.) Does it make any difference if each cylinder of a twin is fitted with a different kind of sparking plug? (4.) Which is to be preferred, hand or foot control for the clutch?—G.E.A.

(1.) There would be no objection whatever to your having a single lever carburetter fitted to your 6 h.p. machine. Provided you buy a carburetter of good make it will be quite satisfactory. It should not affect the running as regards flexibility, slow running and power, but

it might be a very little more extravagant. (2.) A 6 h.p. machine is a little heavy for solo riding, but many people do not mind weight. There are numerous riders of 7 h.p. solo machines. (3.) It does not matter at all, provided both plugs are good. (4.) This is largely a matter of taste. For solo riding a hand clutch is best, while probably for sidecar work a foot clutch is to be preferred. Dual control is fitted to some machines. This, of course, is best of all.

### Lack of Power on One Cylinder.

**?** I should be much obliged if you could suggest what is wrong with my 1913 7 h.p. Indian. It seems as if the back cylinder is running fully retarded, as the sound of the exhaust is just a slow dull flop. When running on the stand, if I short the front cylinder the back one just turns over, but if I short the back cylinder the front one races away as usual. I have cleaned the points, also the carbon brushes and holder, and checked the valve timing (which is quite correct); the lift is the same on both cylinders, and the ignition is timed to break dead on top when half retarded. There is a good spark at both plug points.—PUZZLED.

It is very difficult to diagnose your trouble from the particulars you give. It is evident, however, that the ignition is not the cause of the trouble. See that the compression on the rear cylinder is as good as on the front. If not, remove the valves, and see that they are in good condition, and grind them in if necessary. Make sure your inlet dome is screwed down tightly, and that there are no air leaks in the induction pipe. If the spark is right, timing right, and compression good, there is no reason why you should experience any trouble. Also make sure all the valve tappets are adjusted correctly. When the engine is cold there should be only just clearance between the inlet tappet rods and rockers, while there should be about ½ mm. between the exhaust tappets.

### IMPORTANT NOTICE.

#### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILLIFFE & SONS LTD.

### Overheating.

**?** I am in great trouble with an N.S.U., which overheats after it has run a mile and stops. I have tried a new silencer. The ignition is all right. I have a B. and B. carburetter, and have tried smaller jets. I use the best oil, and give it plenty. I hope you can give me some information regarding the trouble I am having.—E.M.

We should recommend you to make sure that the engine is free from carbon deposit. Also see that the valves are working properly, that the exhaust valve has its full lift, namely about ½ in., and that the valve springs have not lost their temper. The trouble may also be caused by a faulty plug causing pre-ignition. Try one of good make with substantial electrodes.

### Knocking on a Two-stroke.

**?** I should be much obliged if you could advise me as to the probable cause of a recent development of persistent knocking in my three-speed 1914 two-stroke motor bicycle. I bought the machine second-hand in March last, when it seemed to be in good tune, and I was assured the main bearings had recently been rebushed. Since then, owing to unsatisfactory running and a tendency to overheat, I have had the engine taken down and thoroughly overhauled and decarbonised by a local man. The main bearing was reported all right, but the big end bearing was loose and so was rebushed. Since then, except for a temporary trouble caused by getting water in the tank, the machine has gone well on the few occasions I have been able to use it. But quite lately (it has hardly done 120 miles since the overhaul) I found a strong tendency to knock—in fact, with the air lever anything like fully open it would be knocking nearly all the time, even on the level, and, of course, more so up hills. The machine would run best with the air nearly closed. Advancing or retarding the spark seemed to make little or no difference. The agent says he thinks the fault is in the bearings.—H.L.L.

We think the trouble is probably due to a partially choked jet, which causes a weak mixture, and, consequently, knocking. Make sure the exhaust gases are not muffled or choked in any way. Two-strokes, if they have been run at all hard, are sometimes inclined to get the piston rings gummed up, which might also cause bad running and knocking. This is one of those troubles which is exceedingly hard to diagnose without actually seeing the machine.

## Overheating.

**?** My 1912 6 h.p. sidecar combination has started to overheat in an alarming manner. This is what happens. It starts up fairly easily after an injection with the spark fully advanced, half gas and half air, and then races like mad, and gets almost red hot in three minutes. I have tried to get it to run slowly, but cannot; it either races or stops; it does not at any time develop full power, and the consumption is only 45 m.p.g. The back cylinder gets hotter than the front, though the engine is well lubricated, and the pistons are if anything a bit loose in the cylinders, and the exhaust is not baffled in any way. Can it be that the magneto timing is not correct?—H.G.S.

What we should recommend you to do is to give the machine a thorough overhaul. Take off the cylinder, remove the carbon deposit, clean the rings, see to the valves, also that their springs are strong enough, and in reassembling be especially careful to see that there are no air leaks at the carburetter or induction pipe unions. The engine refusing to run slowly is most likely due to one of the faults mentioned. Make sure that the jet is not too large; you should not be able to start with air lever half open. When fully closed and throttle only just open slow running should be possible.

## Heated Crank Case.

**?** (1.) I have a 1913 Triumph, carefully used; big and little ends good. Recently I had trouble with loss of power and overheating in crank case. I took the engine down, but the trouble continued, with, at times, misfiring. Eventually the engine was taken down by the agent, who, thinking gases got past, replaced the top piston ring with one 1000 in. wider. I was then told it would be all right. Now a trial run of twelve miles proves that the crank case and the case, including chain, between timing gear and magneto, are just as hot. The compression is good. I use Mobiloil BB. What do you advise? (2.) What is the cause of the Starmey-Archer three-speed hub screeching when starting away by clutch on low gear?—C.G.J.

(1.) The crank case of practically any air-cooled engine gets fairly hot, so, unless extremely bad, this trouble need not worry you. If the compression is good, it is not likely that the heat of the crank case is due to the exploded gases leaking past the piston rings, but simply to conducted heat from the cylinder. The loss of power may be due to incorrect carburetter setting, or pitted or stretched valves, or even a faulty plug. Use one of the single-point variety of good make. (2.) The screeching when letting in the clutch is probably due to the clutch requiring lubrication. Lubricate the hub freely with thin engine oil.

## Refusal to Fire after Overhaul.

**?** I have a 2½ h.p. twin motor cycle—1911 Enfield—which I took down, and had a new hush fitted to the pulley side. Before I took it down it ran well, now I cannot get it to run. It will fire now and again, but will not pick up. It is only the back cylinder that fires. I have tried different valve and magneto timings, but without success. After trying it and taking out the plugs I find the front one is wet with petrol and the back one dry. I have had the magneto to pieces, and it gives a good spark when off the machine, but when on the front cylinder does not appear to be such a good spark as the back. The carburetter has no jet, the float is enclosed in a brass cup in two parts. (1.) Should the top part of the cup holding the float be loose when the bottom is screwed up tightly? (2.) How does the carburetter work, and how is it adjusted? (3.) Could you give me the correct valve timing? (4.) The correct magneto timing? (5.) The magneto couplings are a little slack, would this make any difference?—C.J.P.

It is possible that you have not refitted the carburetter correctly and an air leak now exists. Make sure all connections between the carburetter and the engine are airtight; also see that both the electrical cables are sound and not shorting anywhere. (1.) The top part of the carburetter should not be loose. (2.) There are two small cuts at the joint of the flood chamber. These act as jets, and one supplies each cylinder. It is, therefore, important that they should be identical in size, and free from obstruction. It is quite possible that the source of your trouble lies here. (3.) The exhaust valve should close on the top of the exhaust stroke, and the inlet commence to open immediately after the exhaust closes. (4.) The contact points should commence to separate when the piston is on the dead centre of the compression and firing strokes, the magneto being then fully retarded. The advance and retard of the ignition on this machine does not take place on the magneto itself as is usual in most cases but on the magneto transmission. (5.) The magneto couplings being slack should not interfere with the spark, but this might affect the timing.

## AN ECONOMICAL METHOD OF MILK DELIVERY.

Sidecarrier supplied by A. Pilkington, Aston Road, Birmingham, to a Midland dairyman. The owner uses it for conveying milk from his farm, five miles from Birmingham, and delivering direct to customers. The two churns when full contain 36 gallons and weigh nearly 4 cwt.

## RECOMMENDED ROUTES.

## COVENTRY TO SWINDON.—L.T.K.

Coventry, Warwick, Wellesbourne, Hastings, Halford, Moreton-in-the-Marsh, Stow-on-the-Wold, Burford, Lechlade, Swindon.

## GLASGOW TO DARLINGTON.—C.McC.

Glasgow, Hamilton, Lesmahagow, Douglas Mill, Abington, Crawford, Beattock, Lockerbie, Ecclefechan, Longtown, Bampton, Alston, Middleton-in-Teesdale, Barnard Castle, Darlington.

## GRANTHAM TO PLYMOUTH.—A.G.P.M.

Grantham, Melton Mowbray, Leicester, Wolvey, Coventry, Warwick, Stratford-on-Avon, Evesham, Cheltenham, Painswick, Stroud, Nailsworth, Dunkirk, Bath, Chewton Mendip, Wells, Glastonbury, Durston, Taunton, Wellington, Callompton, Exeter, Chudleigh, Ashburton, Ivybridge, Plymouth.

## LONDON TO EDINBURGH.—R.W.H.

### EXTRACTS FROM RECENT LETTERS.

"I cannot give even an approximation of the mileage belt has done, as I ride, more or less, every day, winter and summer. Since I have had the belt I have twice toured the Lake District (it having taken me over Honister and Kirkstone), once through Derbyshire and North Wales, and once through South Wales and Somersetshire; also to the South and West of Scotland. A lot of my riding is done over the Yorkshire Moor and Coast roads."

"Having tested your belt and given it a good trial I think it only right to let you know the result. Since I took up motor cycling, eight years ago, I have had nothing but trouble with belts—slipping, stretching, and short life: since using the 'ZILLA' I have been quite free from all belt trouble. Anyone using a Rudge-Multi or other variable geared machine should not hesitate but use a 'ZILLA' and say good-bye to other makes."

Take the advice of experienced riders and order at once.

# Letters To the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

## Paraffin Vaporiser.

Sir,—Allow me a small space in your valuable paper to contradict Mr. T. Silver's claim to being the inventor of the paraffin vaporiser as illustrated on page 99 in your issue of August 3rd.

Over two years ago I invented a vaporiser by which the cheapest paraffin could be used. We fitted dozens of different makes of machines with this device, and nearly every machine in this neighbourhood (West Dulwich, S.E.) is so fitted, and my present Morgan is running quite gaily with the jacket, and I only use petrol for starting. All I do is to unscrew the float chamber top and fill it with petrol.

A. DURANT, Oakleigh Motor Co.

## Two Tips from France.

Sir,—Enclosed are two rough sketches of little improvements I have made to my 1916 Triumph. I have had a great deal of trouble with broken front fork springs, which is a very common complaint out here, so I have fitted a 4 h.p. Douglas spring, as shown in the first sketch, using two pieces of good spring steel for the purpose. The nut in front is a

Supplementary spring added to a military Triumph. (See letter from "F. C. H., Corporal R.E.")

rear hub nut, the collar on which compensates the loss of thread, due to the thickness of the spring steel plate B. I have had this on for some months, and have not broken a spring since it has been fitted.

Metal cover on the quadrant of Sturmev-Archer countershaft gear, the object of which is to ward off dirt and keep petrol from washing away the lubricant.

The second sketch relates to the change gear quadrant. I find that on flooding the carburetter all lubricant on the quadrant is immediately washed off and the lever jams. To overcome this I have made a box of thin sheet iron, with the valve cap of a car tyre for the plunger guide. This box is

bolted on with the lever bolts and moves with the lever, and has been very satisfactory indeed, the lever never having jammed since it was fitted.

B.E.F.

F.C.H., Corporal R.E.

## Spring Frames and Freak Hills.

Sir,—In reply to Mr. Bethwaite, I should be delighted to try any Lakeland hill on my spring frame Indian, and when I wrote my first letter fully expected a challenge, but unfortunately its publication was held back fourteen days, and I am now in the M.T., A.S.C., at London, S.W., so cannot fix up any date.

A. ROBINSON.

## A Memory of the Ill-fated International Six Days Trial.

Sir,—It is now just two years since we beat our hasty retreat from Grenoble. It was such a beautiful spot. I should have been quite content to stay, *mais non, c'est la guerre*, and what a time we had nevertheless! I thoroughly enjoyed it. I could not allow the date to pass without writing to you in commemoration of our trip, etc. I cannot tell you how welcome we have found *The Motor Cycle*, both when I was at the Front and in Rouen.

(Pte.) MAURICE GREENWOOD, A.S.C., M.T.

## The Boycott of German Goods.

Sir,—In the early part of 1915 you kindly inserted a letter in which I urged the boycott of German-made goods.

I did not, of course, refer to goods already in this country, but to new goods which it might be assumed Germany would seek to import after the war. I suggested that joint action on the part of the Auto Cycle Union and the Manufacturers' Union, on what may be called the official side, and a league of motor cyclists pledged not to use new goods of German origin on the "users' side of the movement, would easily bring about the desired result.

The proprietors of *The Motor Cycle* have now set an example to the publishers of the kingdom in announcing that they will not permit the advertisements of new goods manufactured in enemy countries to appear in any of their publications, either during or after the war. This encourages me again to make an appeal to motor cyclists, especially as I am no longer "a voice crying in the wilderness" in this matter. To-day most thinking men agree that our victory over Germany in actual warfare will be only half a victory if we leave her free to pursue her economic fight against us after active hostilities have ceased. By her pre-war methods, and because of our slackness, Germany succeeded in acquiring control of many of our prime necessities in manufactures; and her insidious, penetrating, pernicious influence entered into, and often undermined, our commercial activities in every field. No doubt we got many goods cheaper in consequence, but we helped Germany to build up the war machine designed to crush us, and now have to pay an appalling price in human life and treasure in order to smash that machine. Without entering into party politics, one may say that surely a policy of so-called "cheapness" which does not count the ultimate cost must be smashed also!

For our own protection, for the building up of British industries, for the general prosperity of the Empire, we must shut out German competition, at least for a term of years. But there is another, and, as I think, a greater, reason still, namely, the necessity for punishing a nation which, by its conduct during the war, has literally put itself outside the pale of civilisation.

Think of the evidence of Lord Bryce's Committee relating to the first invasion of Belgium and France; of the treatment of the British prisoners in Ruhleben and elsewhere; of the sinking of the *Lusitania*; of the murder of Nurse Cavell and of Captain Fryatt; and of the treatment of the natives in German East Africa, the evidence of which has only recently come to hand. Are not these things sufficient to justify one saying that Germany must not only be beaten in the field, but also punished for a term of years after active hostilities have ceased?

It may be said that any form of punishment would not be in accordance with the British spirit of sportsmanship, and might, indeed, be called vindictive. The answer is that Germany is not a clean fighter, and the just punishment of crime is not vindictiveness. The "German Kultur" spirit is abnormal in its extreme egotism, its cruelty, and its bestial attributes. For the sake of the German people themselves, in the name of humanity and freedom, and all that is best in us, that spirit of "German Kultur" must be crushed, and we must do our share in our own small way in the effort which will be needed to crush it.

It may be urged that for such an attempt a league of motor cyclists is superfluous, as the Government can be trusted not to permit the importation of German goods after the war. No one, however, who reflects upon the happenings of the past two years will trust this or any future Government to take the necessary action, unless the force of public opinion compels such action to be taken.

The existence of a strong league of motor cyclists might well prove to be a determining factor in the case. At all events, it can do our cause no harm to form such a league, and, on the other hand, it may prove the nucleus of a really powerful national body, able to make its influence felt whenever any question arises which affects the interests of motor cyclists in future.

A simple illustration of the value of combined effort is shown in the recent successful resistance of the Government's scheme for the taxation of motor cycles.

I do not lose sight of the fact that the A.C.U. is a league of motor cyclists in a sense, and I know that the A.C.U. was responsible for the successful resistance referred to. I would personally prefer the A.C.U. so to enlarge its constitution as to include all motor cyclists wishing to combine for this particular purpose on payment of a nominal fee of, say, 1s. a year. Perhaps this may be the result of my letter, but in order to test the possibility of the formation of such a league, may I ask each one of your readers in sympathy to be good enough to send me his, or her, name and address, stating if willing to join such a league, either running as a separate body, or, preferably, linked up to the A.C.U. Should the response be adequate, further steps would be taken in the matter without delay.

BRITISHER.

[Letters may be addressed to "Britisher," c/o *The Motor Cycle*.—Ed.]

#### Paraffin as a Fuel.

Sir,—The official Petrol Committee has undoubtedly been most indiscriminating in its "rushed job"; but, rather than whine about half a gallon a week—even which amount I doubt if many motor cyclists will actually get, as it will all probably be wanted for more important vehicles, such as aircraft—we ought to be grateful to receive a licence for this small amount, which can ill be spared.

I am a keen motor cyclist myself, and run a heavy twin, which I have by no means laid up. I find I can start up on three or four injections of methylated spirit, and if the engine is kept revving well it will then continue to run quite excellently on Royal Daylight, or better still on Benzolite. This from cold.

The great objection to the general use of paraffin is that the price will jump up, which will be hard on the poorer classes who use this as the cheapest means of illumination—bar daylight—and then doubtless the Government will step in once more to the accompaniment of more whimpering, no doubt.

C. CASH.

Sir,—I think the following perhaps may be of interest to your readers, especially to riders of the B.S.A. machines.

I emptied the tank of my B.S.A. (model H and coachbuilt sidecar, with combined weight of passenger and driver, twenty stone), and put in 50% of petrol and paraffin, and

ran the combination over a fairly hilly course at a speed of from twenty to twenty-five miles per hour. The engine, after running fifty-eight and a half miles to the half gallon, stopped firing. The engine started from cold after the second or third kick with no petrol injection; when warm the engine would start at the first kick. On my next run I tried common paraffin, only sixpence for half a gallon. I emptied the tank and put in the half gallon of paraffin, injected a little petrol in the cylinder, and the engine started at the first kick from cold, and fired right away without any trouble. The engine stopped firing after a run of fifty-four miles on sixpennyworth of common paraffin; there was not the slightest sign of overheating on the mixture or the paraffin. On the 50% mixture the engine seemed to pull better than on petrol only. On the paraffin it was not quite so powerful. I ran the above fuels without any alterations to the carburette or engine.

W. E. MANNING.

Sir,—I have been using paraffin for some time in my 2½ h.p. Levis two-stroke motor cycle with very good results. Perhaps my idea would be useful to other two-stroke riders, should you consider it worth publishing.

I have reversed the induction pipe on the cylinder. This brings the carburetter (Amac) in front of the cylinder instead of behind; it is then close to the exhaust pipe, from which I take hot air through a funnel fitted from the main intake of the carburetter round the exhaust pipe. (The bend of an old motor cycle horn suits admirably.)

I have also fitted a jacket to the vaporising chamber of the carburetter made from a 2in. length of steel cycle tubing by splitting and bending out into U shape. A large hole is bored in the back through which the union pipe of the carburetter can pass, after the union nut is removed. Two ends are then brazed on, scribed, and filed out, and the whole made to butt up nicely to the vaporising chamber of the carburetter.

The depth of this jacket is about ¼in., just sufficient to be held in position by the union nut when tightened on the induction pipe. Into this "jacket," through a hole near the top, I brought a ¼in. bore copper pipe, the other end of which was tapped into the exhaust pipe near the cylinder. A few ⅛in. holes at the opposite side of the "jacket" near the bottom allowed the exhaust gases to escape.

The carburetter gets so hot after a minute's running that the hand could not be held on it. It gives very good vaporisation of the paraffin.

Again I set the float chamber as far forward as possible. I find this gives the carburetter an automatic action, the fuel level adjusting itself to road gradients, and doing away with the necessity of using the air lever so much when taking hills.

I start by filling the float chamber with petrol. Should I have forgotten to run the carburetter dry before stopping it is easily emptied with a squirt as used for injecting petrol into compression taps.

J. J. MEEHAN.

#### PETROL PERMITS.

"We ask people their requirements and then we distribute the petrol pro rata between the classes according to the urgency and utility of their services."

—First Commissioner of Works,  
House of Commons, August 1st.

Many letters continue to reach us on this subject, but space does not admit of the publication of these in full.

"J.S.B." uses a machine for business purposes, and asked for twenty-eight gallons per month. He gets two gallons, while a friend, who has a car for occasional hire, is allotted no less than seventy gallons per month.

"R.E." states that he and a friend both use their machines for identical purposes—partly military and partly private. The friend asked for twelve gallons and got it. "R.E." asked for eighteen gallons and gets six.

"W.M.S." and "S.E." filled up forms on the first day, and have twice written since that time to the Petrol Committee, but so far have had no allotment at all.

"Scottish Road Surveyor," who for nearly ten years has used his motor cycle solely on his rounds, on receiving the usual allowance of two gallons per month, wrote to the Petrol Committee asking for a larger supply, and was told that this was impossible.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT.

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

"The time has come," the sad man said,  
"To talk of many things—  
Of motor bikes and permits for  
A pilot of gasoline;  
And whether it is wise to try  
Running on paraffin."

# EASY

"Quite easy," said the optimist.

"To have a pleasant run—

On paraffin and petrol mixed

The Indian goes like fun."

The sad man cheered up much at that,

And promptly ordered one.

So much depends on the machine. Purchase a good one, properly tuned up by experts, and whether new or second-hand you will get satisfactory running on a mixed spirit. Buy a dud machine and the best petrol will be wasted on it.

The Moral is : Deal with GODFREY'S.

## NEW MODELS IN STOCK

## Sun.

SUN-VILLIERS, 1916, riding 87 miles only, perfect; £22/10.—Walbro Motor Works, Ely. [X5657]

SUN, 2-strokes; all models from stock from 29/10.—Colmore Depot, 261, Deansgate, Manchester. [X0828]

COLMORE Depots, Birmingham and Manchester, for delivery from stock of all models of Sun motor cycles. [X0807]

SUN-PRECISION, 3½ h.p., 3-speed, S.A., tyres good, lamps, horn, perfect; £25.—15, Leamington Place, Beach St., Birmingham. [X5781]

2-SPEED 2-stroke Sun Motor Bicycle, run under 50 miles, equal to new, fitted with Dunlop tyres, guaranteed in perfect condition; £30.—Robinson's Garage, Green St., Cambridge. [X6550]

## Sunbeam.

SUNBEAM, 2½ h.p., 2 speeds; £32.—3, Burgons Buildings, Fallowfield. [X5515]

SUNBEAM 1916 3½ h.p. Combination, with accessories; £80.—Stour Cycle Depot, Stourbridge. [X5835]

1914 6 h.p. Sunbeam, No. 5 Gloria car, hood and screen, and fittings; £75.—Sleightholme, Ironbridge, Wiltshire. [X5868]

SUNBEAM, 2½ h.p., 1914, 2 speeds, free engine, h.b.c. clutch, tyres good, lamp set, speedometer, horn; £50.—Consins, Coppice Rd., Theydon Bois, Essex. [X5442]

## T.D.C.

T.D.C. and Hercules, 1914½, 4 h.p., 3-speed, free, clutch, Bosch, Sensapar, Stewart, lamps, practically new condition; £30.—Advertiser, 132, Caulfield Rd., East Ham. [X5666]

## Torpedo.

TORPEDO, 2-stroke, practically new; £18.—R. H. S. Oliver, Sunnycroft, Bury St. Edmunds. [X5653]

TORPEDO, 1914, 2-stroke, good order; must clear; £15.—Ideal Cycle Co., Thundersley, Essex. [X6662]

## Triumph.

1913 T.T. Triumph; any trial here; £28.—D. Fox, Tamworth Rd., Lichfield. [X5765]

TRIUMPH, 3½ h.p., free engine, Oct. 1912, carefully used; £29.—Judge, Chemist, Derby. [X5818]

TRIUMPH, 1915, 3 speeds, 3½ h.p., in nice condition; £54.—6, Warren St., London. [X5987]

TRIUMPH, 1912, 3½ h.p., clutch, fine condition; £25.—T., 6, Manor Parade, Sutton, Surrey. [X6334]

1912 Triumph, 3½ h.p., free engine; £30.—Seen Stannall, Skin Market Place, Bankside, S.E. [X5932]

TRIUMPH, 1915 Baby, 2-stroke, like new, guaranteed perfect, suit lady or gent; £36.—Moss, Warr. [X5864]

TRIUMPH, 3½ h.p., 1912 model, free engine, spare tyre, tube, lamps, tools, etc.; £24.—242, Brownhill Rd., Catford. [X5963]

TRIUMPH, 1913, 3½ h.p., good condition, accessories, £31, or near.—Lieut. Sherrard, 3/5th Essex, Halton Camp, Bucks. [X5861]

TRIUMPH, 1911, clutch, re-enamelled, re-plated, new tyres and belt, like new, only wants seeing; £25.—Saunders, Brockwell, Chesham. [X5778]

1910 Triumph, Brompton gear, extra heavy Dunlops, especially good condition; £19/10; approval.—Goodey, Gishorne Rd., Wellingborough. [X5831]

3½ h.p. Triumph, free engine, clutch, lamps, etc., condition as new; a bargain, £22; 100 m.p.g.—Smith, 15, Branshott Av., Charlton, S.E. [X6200]

TRIUMPH, 1913½, excellent condition, engine just returned Triumph, lamp, horn, Palmers, Pedley belt; 26 gns.—Monck, Offenham, Evesham. [X5913]

TRIUMPH, 4 h.p., 1914, fitted 3 speeds, lamps, horn, tools, 18 gns. Gloria sidecar, in splendid order; £52/10.—Batchelor, Clarence St., Kingston. [X6588]

1914 Triumph, 4 h.p., 3-speed, with C.B. sidecar, in excellent condition; £45, or would exchange for higher power twin.—3, Portland Rd., Wyke, Weymouth. [X5949]

## ACTUALLY IN STOCK.

## MOTOR CYCLES FOR SALE.

## Triumph.

TRIUMPH, 1911, 3½ h.p., free engine, pedal start, Grado pulley, and wicker sidecar; £26/10; before 1 o'clock.—A., 129, Warwick Rd., Earl's Court, London. [X5808]

1913 Triumph, 3 speeds, sidecar, splendid condition; £35, or exchange with cash for 8 h.p. combination.—Wood, 33, Craig St., Bletchley, Leamington, Scotland. [X5844]

1915 Free Engine Triumph, new piston and cylinder, 1915 Philpiston pulley, nearly new tyres, just overhauled; £30.—Gates, Post Office, Liviaghoe, near Tring. [X9674]

1912 Triumph, dropped handle-bars, footboards, Brompton variable gear, engine-re-bushed, new rings, etc., tyres perfect; £32.—Salter, Dry Sandford, Abingdon. [X9635]

TRIUMPH, 1912, 3½ h.p., free engine, exceedingly good machine, mechanical condition and appearance as new, accessories, spares; 25 gns.—Clark, North Witham, Graitham. [X9573]

1912½ Triumph, Sturmer 1915 3-speed, machine just returned from makers, re-bushed, new valves, also splendid coachbuilt sidecar; £35; exchange 4 h.p. Zenith, give cash adjustment.—11, Garnies St., Peckham. [X9567]

TRIUMPH, 3½ h.p., F.E. clutch, Cowey, Lucas front and rear lamps, Philpiston, new rear tyre, others nearly new, new belt, new piston, etc., cane sidecar, splendid condition; £28.—Ilughes, Tanlan, Bettws-y-Coed, North Wales. [X5694]

## Trump.

TRUMP-J.A.P., 5-h.p. twin, and Canoelet sidecar, 3-speed, handle start, new tyres; £35.—14, Dodbrooke Rd., West Norwood. [X9689]

## Waverley.

WAVERLEY-J.A.P., 8 h.p., semi T.T. combination, understing torpedo sidecar, Indian red, clutch, handle starting, new 11a. belt, sporty lot; a snip, 28 gns.; must sell.—Cpl., 4, Springfield Terrace, Chatham. [X9502]

## Williamson.

WILLIAMSON, 1914, 2 speeds and clutch, wicker sidecar, good condition; £52/10, or close offer.—12, Myddleton Rd., Bowes Park. [X9568]

## Win-Precision.

3½ h.p. Win-Precision, 2-speed countershaft gear, kick-starter, nearly new coachbuilt sidecar, accessories; nearest £38.—Apply, 342, Baker St., Enfield. [X9631]

## Wolf.

1916½ Wolf, 2-stroke, 2-speed, countershaft, cost £44 with accessories April, receipt shown, looks and is like new; sacrifice 30 gns.—15, Summerhill Rd., Dartford, Kent. [X9617]

## Zenith.

4 h.p. Zenith-Gradua C.B. Combination, red; absolute bargain, £35; spares, accessories.—13, Arklow Rd., New Cross, S.E. [X9615]

3½ h.p. Zenith-Gradua, with sidecar, complete, unready deemed pledge; £27/10.—Fish, Pawnbroker, 25, High St., East Ham. [X5725]

PETROL.—Six gallons given with 1912 Zenith, 3½ h.p., 22 gns.; sidecar to suit.—Rider Troward, 78, High St., Hampstead. Phone: 5392. [X9698]

ZENITH-GRADUA, 1913, 8 h.p., and coachbuilt sidecar, smart, fast, economical; bargain, 30 gns.—Grimston, 154, The Rye, East Dulwich. [X9539]

ZENITH Motor, 3½ h.p., model 1913-14, with speedometer, good condition, new tyres; price £24.—Dehonsse, 55, Cresswell Rd., Twickenham. [X9684]

1914 Zenith-Gradua, J.A.P. 3½ h.p. twin, Bosch engine and mag. just overhauled and parts renewed (cost over £8) all accessories, many spares, P. and H. lamps, horn; owner going abroad; £37, or near offer.—Write, G.H., 800, c/o Deacon's, Leadenhall St., E.C. [X9533]

## Miscellaneous.

EAGLES.—Chater-Lea, 8 h.p., 1912-13, J.A.P. engine, 3-speed countershaft gear, chain drive, 650×65 tyres, with sidecar; £43/10.

EAGLES.—Imperial-Jap, 2½ h.p., 1915, 2 speeds, smart appearance; £25/10.

EAGLES.—N.S.U., 3½ h.p. Model de Luxe, spring frame, 2 speeds, coachbuilt sidecar; £29/10.

EAGLES.—Rudge, 3½ h.p. touring model, N.S.U. 2-speed gear, free engine, pedal starting, fine sidecar machine, accessories; £30.

EAGLES.—Wolf, 2½ h.p., 1916, 2-stroke, shop-soiled; £25.

EAGLES.—Triumph, 3½ h.p., standard 1909, overhauled, all accessories; £18/10.

EAGLES.—Calthorpe-Jap, 2½ h.p., brand new 1915, Enfield 2-speed gear, slightly soiled; £32.

EAGLES.—Trump-Jap, 4 h.p., 1913, 3-speed gear, foot clutch, kick-starter, complete; £30.

EAGLES.—Douglas, 2½ h.p., 1913, 2 speeds, free engine, kick starter, new condition; £34/10.

EAGLES.—Wolf, 2½ h.p., 1914, overhead inlet valve, variable mag., fine condition; £15.

EAGLES.—Any of the above can be had on approval "The Motor Cycle" deposit system.—Eagles and Co., High St., Acton, W. [X5715]

## Noise.

**W**E wonder how many times we have written on this subject, but we make no excuse for dealing with it again, as noise is as bad on motor cycles at the present time as ever it was. It is not always the same noise which offends. Hitherto we have been concerned chiefly with the strident sound of the exhaust; legislation has somewhat minimised this defect, so there are not now quite the same grounds for complaint. What we are concerned with at present is valve clatter and transmission noises. These are worse on multi-cylinder engines, which owing to the number of valves and tappets set up a clatter which the makers could, we feel, readily eliminate if they would take the trouble. At high and medium speeds the chorus becomes merged into that more or less harmonious "continuity of sound which we call silence."

Silence can be largely attained without sacrificing much in efficiency, and first of all steps should be taken to quieten the tappets and valve gear. We do not expect complete silence, but we do expect an improvement in this direction. Chain noises are easier to cure, as this may be done by the simple operation of fitting a chain case, though unless this is well done it may make the noise worse. Gear box noises are quite unnecessary, and fortunately are not common, but we have come across quite a bad instance lately.

It is not only the four-stroke engine which is the offender, the two-stroke also is a sinner in respect of unnecessary noise. Not only is its exhaust more trying to the ear than that of a four-stroke, but it is prone to that curious "two-stroke rattle" about which there has been so much correspondence in our pages.

If manufacturers would perfect their productions by improving flexibility, reducing noise, and making machines more accessible and more easily started, the motor cyclist's lot would be far happier. A man rides a motor cycle to get health

and benefit therefrom, and attaches a sidecar so that he may share his enjoyment with another, but he does not want his companions to be irritated by a clatter which renders it necessary to shout so as to carry on a conversation.

## Signalling.

**T**HAT a considerable amount of misconception exists on the matter of signalling with the hand when turning corners is very evident. Not long ago a motor cyclist turning into a main road put out his right hand, meaning that he intended to turn to the right. The driver of an approaching car took it that the cyclist would remain on the right hand side of the road instead of crossing in front of him, and turned to his own right; the cyclist, however, crossed to his left and a collision resulted. Each driver blamed the other, but we are of opinion that the unnecessary signal was the cause of the accident.

Generally speaking, only one signal is necessary, and that should be made by extending the right hand when about to turn off the main road to the right, for when doing this the rider takes the road of following traffic which should overtake him on his right as well as the road of oncoming traffic. This signal should be made in ample time to allow the following traffic to change its course. It is not sufficient to extend the hand and immediately to turn across the road, as in this case it may be impossible for a vehicle coming up quickly from behind on the right to avoid a collision. Another signal, useful at times, is that of beckoning with the right hand as a sign that following vehicles should pass.

All motorists know that horse drivers are very remiss in the matter of signalling, and are constantly on the look-out for unexpected movements when overtaking vans and tradesmen's carts, but they do expect some signal from a fellow motorist before he leaves his own proper side of the road.

# MY FIRST WEEK AS A MOTOR CYCLIST

Being the Initial Experiences of an Australian Girl who learnt to Ride in England.

The writer of the article, a native of Melbourne, riding her two-stroke Allon in a Somerset lane.

I ALWAYS wanted to ride a motor bicycle. I did not even dare to suggest it to my people, because they are nervous, and considered that, for a girl to say that she wanted to ride a motor bicycle, was but another way of saying she wanted to commit suicide. At length I left my native land, and came to this lovely old England of yours, and went to live in Somerset.

The first week I was there, the girl with whose family I was enjoying a holiday wheeled out her father's two-stroke Triumph, and, mounting unconcernedly, flew off up the road and out of sight, as if such a proceeding was an everyday occurrence, as I learned later it was. I waited all the afternoon for the stretcher which I fully expected would bear home her remains, but I waited in vain. She rode home again some hours later, looking wind-blown certainly, but fresh as a daisy.

Meeting her at the gate, the following conversation ensued:

"How did you have the courage?" I asked.

"The courage for what?"

"Why to ride that!" I said, pointing at the Triumph.

"Courage! It didn't need courage!" she exclaimed.

"Anyone could ride this."

"Do you think I could do it?" I asked.

"Certainly you could," she said; "but I would not advise you to try and practise on father's machine. Can you ride at all?" she asked.

"A push-bicycle," I said, glad that I could ride something.

"That won't help you much!"

My gladness vanished.

Another week passed, and my friend took further excursions. I got restive. Finally I bought a two-stroke Allon, and a friend who rode a similar machine undertook to teach me to ride on a lonely stretch of road. After a few minutes' instruction in the use of the various control levers, I was allowed to mount, my friend running along by my side. I was very surprised at the ease with which I could manage it, and rode home, about a mile and a quarter, un-

aided. I had gained my long-wished-for goal! - After that first ride I felt somewhat exhausted, probably from the nervous strain, but after a second ride this feeling vanished, and I began to experience the joys of the rush through the fine summer air.

## Conclusions with a Hedge.

The third time I was out with my girl friend, I had rather an exciting experience. She was riding the Baby Triumph, and about a hundred yards ahead of me took a right-angled corner in fine style. When I was halfway round the corner, to my horror, I realised that the Allon "had the bit between its teeth," and was rushing at ninety miles an hour (or so it seemed to me) straight for the hedge on the off side of the turn. I just had presence of mind enough to use the foot brake, when the machine struck the hedge and reared right up on its hind legs, so to speak. It was a very thorny hedge. For a second the bicycle was undecided as to falling backwards on me or forwards. Fortunately, it did the latter, and I slid gracefully over the back mudguard, to the great interest of three men on a haystack, who were looking on with open-mouthed amazement. I managed to pull the machine out of the hedge, and mounted again quite unhurt. Whenever a difficult corner presents itself now I take great care to take it as close as is compatible with the laws of the road, so as to leave a good space to run out in case of emergency.

Another time I started off up the High Street in full view of the townsfolk, confident that I looked an experienced motor cyclist, but, after a run of about 200 yards, the Allon, with a resigned sigh, stopped dead. I knew less about machines than I cared to admit, and after a few minutes a man standing by, after a contemplative stare at the bicycle, remarked, "Wouldn't it be as well to turn on your petrol, Miss; her might go then?" "Miss" did so and departed. The end of my troubles was not yet, however. About three miles further on, as I was spinning along, very contented with myself for having negotiated a curve in great style, a herd of cows came into sight, and I started to wobble badly. I could not find the brake, and, in my flurry, opened the throttle full out. The bicycle, with a seening yell of delight, started to show what it could do, but after a short wild flight, and just

The girl who introduced the writer to the delights of motor cycling riding a Baby Triumph.

**My First Week as a Motor Cyclist.—**

as I was about to spring on to the foremost bovine bosom, I gathered my wits together, closed the throttle tightly, and lifted the exhaust. The result was a timely halt on the brink of disaster. To add to my discomfort, the herdsman said brightly, "Look out, Miss! The little 'un, she be fierce." Following behind was the tiniest calf I have ever beheld. I quite forgot to say that there were only four cows in the herd, including the "fierce 'un."

My next ride was all pleasure, and I began to feel that I was really mastering the machine. Together with my friend, riding as usual the Baby Triumph, we explored some of the charms of Somerset, and I am looking forward to an early tour.

I am a fairly experienced rider now, and the sport has never lost its charm for me, but rather the pleasure increases with each outing. I think it is "bonza." Australians will understand that.

M.F.

## Rheims as it is now—Thanks to the Germans.

With a Motor Cycle amidst the Ruins of a Famous French Cathedral City.

**A**N excellent impression of the havoc wrought in Rheims by the German guns will be gathered from these illustrations. For many months references have been made from time to time in the French

better from the back. The top view was taken at a street corner, and shows a large private house that has been almost totally demolished.

The photographs were sent us by a French military motor

VIEWS OF RHEIMS  
AFTER BOMBARDMENT  
BY THE GERM-HUNS.

(Photographs passed by the French  
Press Bureau.)

cyclist, and his Triumph may be seen in the pictures. The excellent condition of the stone paving is in striking contrast to the general atmosphere of wreckage and desolation to which the town has been reduced.

## Occasional Comments

Sydney Jones

"By Ixion"

### American Twins.

It does not seem to have dawned upon our correspondents that, whereas practically every American maker lists a 7-9 h.p. twin as his regulation solo model, there is not one British firm of any great dimensions which takes a serious interest in the high-powered twin solo model. A few firms list them, because there is a certain demand from speed merchants in this country; but the majority of big British twins are constructed first and foremost with an eye to sidecar work, and our standard solo models are all of 4 h.p. or less. It would therefore not be surprising if America (specialising on the big twin) could surpass our best 7-9 h.p. types, just as it is only natural that we (specialising on the 2-4 h.p. types) lead the world in our own pet department. Nevertheless, I am not at all sure that our critics are on as sound ground as they imagine. My last three American leviathans, all high-priced machines of leading make, were very, very nice while they were new; but I was not at all sorry when the time came to dispose of them.

### The Speed Factor.

In the above connection it is extremely easy to exaggerate the value of speed records. Their function is to indicate the character of the brains possessed by a firm's designer, for in these days of keen competition most firms can command first class jockeys. But the kind of brain which can work out a record-breaking engine does not necessarily avail to design the ideal touring machine; and even if a factory possesses a brilliant technician, balanced by a practical rider who sees that the machine as a whole is suited to the needs of the common man, the chief essential still remains to be named, viz., honesty. We want, first and foremost, a good, sound, durable machine; we want, secondly, fair treatment from the maker after purchase; we want, thirdly, a machine devoid of irritating little defects, such as discomforts and inaccessibilities; we want fourthly, if we can get it, an engine slightly above the average in refinement and efficiency. Racing successes do no more than imply that we *may* get the latter half of my fourth desideratum. Anybody who lays too great a stress on speed records is, therefore, talking arrant nonsense.

### Sustained Speed.

In all such matters it is, of course, necessary to differentiate between brief speed bursts and sustained speed. A Grand Prix, a Tourist Trophy, and a few other races constitute a searching test of motor manufacturers in many different ways. Victory is only earned by a combination of technical genius, metallurgical knowledge, perfect workmanship, and first-rate foresight and organisation. The more nearly the racing vehicles can be tied down to the semblance of standard models, the better chance there is that manufacturers will acquire knowledge which can be embodied in their next season's model. If the racing

machines are more or less standard in their vital parts, the race then takes the form of compressing testing strains equivalent to a year's ordinary work into a few crowded strenuous hours, and *if the maker is honest* his new models will profit by the race. British makers have a unique reputation for honesty, even if it is coupled with a reputation for a certain blundering stupidity, and such races have, therefore, always brought much fresh custom to British makers. But not a few foreign makers enjoy a widely different reputation. Their racing department is very largely divorced from their manufacturing department, and forms a sub-section of their advertising department. The advertising department performs sensational feats of one sort or another, and so creates a demand. Then the manufacturing department says, "We shall get a big demand this year; we can sell so many machines; how much can we make on them?" and proceeds to cheapen production, and sell machines which disappoint the riders who understand what the victory implied as being possible. There will be a struggle to skim the cream of the motor markets when the war is over, and it may as well be said here and now that we motor cyclists are not such fools as some people in the trade imagine. We may be tempted to sign one cheque by dint of lurid advertising, but we never take very long to learn which firms concentrate their best energies on their stock machines, and which firms treat us fairly after purchase; so that honesty will always be the best policy for the trade as a whole. "Getting your name up" as the first step to success, and "unloading a giant output" as the second step, will never make for continued predominance in the motor cycling world. The royal road is rather to sell us sound machines, and to treat us decently after purchase, and I think that, on the whole, the British maker is easily supreme on these lines, though he would be better than he is if he possessed more of the imagination which distinguishes some of his foreign rivals.

### 520 Miles on Four Gallons.

Do many riders of 3 h.p. Enfields average 130 m.p.g. over such a route as "Auriga" describes in our issue of August 10th? If such experiences are common, I shall have to hurry up and buy a little V twin? I have often tackled approximately the same run on machines of every conceivable horsepower from 2 h.p. to 8 h.p., but I always found my consumption enormous. I suppose I drive a little too fast for low consumptions. On this route there are lots of hills which tempt one to open out, and also plenty of places where a little speed on the flat is safe and pleasant. I suspect "Auriga" is a member of that small minority who retains some reverence for legal limit. I must confess that I have often made his run at 70 m.p.g. on a 2½ h.p. Douglas, and I suppose that my speed is the real culprit rather than my carburetter.

## THE OPINIONS OF A NEW ZEALAND DISTRIBUTER.

WE have recently had an opportunity of renewing our acquaintance with Mr. J. B. Clarkson, of Wellington, N.Z., and took occasion to discuss with him the prospects of business in the outlying parts of the Empire after the war.

Mr. Clarkson is, of course, aware that *The Motor Cycle* holds very strong views as to the enormous value of these markets, and the danger of their being entirely lost to British manufacturers unless immediate steps be taken to conserve them. He agreed, and stated that he has been pressing upon manufacturers the necessity for getting together at once in order to formulate a policy designed to ensure the retention of these markets, and he is of opinion that unless this be done without delay the markets cannot be held.

Regarding methods of manufacture, Mr. Clarkson's view is that each important British manufacturer must concentrate upon a single model, instead of, as at present, dissipating his energies and spending large sums of money in experimenting with machines of differing design or power. Concentration upon the single model, standardisation, an output in thousands and a consequent reduction in cost, and so an ultimate lower price to the buyer, express Mr. Clarkson's views briefly, and upon this phase of the question they are entirely in accordance with our own.

### The Supply of Spares.

Mr. Clarkson's opinion is that British manufacturers' "service" methods are far from satisfactory, particularly in the matter of spares. He emphasises the need for a well-organised spares department as an essential part of the selling side. In this connection, from personal inspection, we may say that Mr. Clarkson's "spares" department in Wellington is one of the finest we have ever seen at home or abroad. This he claims to be due to his own business methods rather than to the support of British manufacturers at home.

### The Price Question.

When we reached the question of selling prices Overseas as compared with those at home, we were specially gratified to have Mr. Clark-

son's view expressed that there is great need for improvement in this particular, and that, as we have always contended, the abnormally high prices charged unquestionably check sales and so restrict the growth of the movement. Mr. Clarkson's opinion is that reform is necessary at both ends of the business; that is to say, by increased output the manufacturers' selling price must be considerably reduced, and, on the other hand, it should be possible to reduce considerably the agent's selling expenses. He naturally contended that business as between British manufacturers and Overseas buyers necessitates wholesale distributing houses such as his own. He asserts that his organisation can sell more machines, and more economically, than a British firm would do by establishing its own distributing centre in New Zealand, or in Australia, as the case may be; but he entirely agrees that the difference in prices at home and Overseas is far too great, and admits that this is to a considerable extent due to want of control of selling agents' prices.

### Easy Payments.

We expressed the opinion that the machine passes through too many hands and carries too many intermediate profits. Mr. Clarkson was disposed to agree, though he thought that the easy payment system has a great deal to do with the differences in prices. He states that the vast majority of machines are sold in New Zealand on easy payment terms, and that it is usual for the agent to add 10% to his ordinary selling price

for the concession of extended payments.

Incidentally, Mr. Clarkson complained of heavy freight charges, and is of opinion that State control of our shipping would probably reduce the cost of freight on motor bicycles by 30s. each.

### Immediate Action Necessary.

Mr. Clarkson's views confirm us in our frequently expressed opinion that manufacturers must lay their plans immediately, must thoroughly overhaul their methods, and must fix up agencies with maximum selling prices for their machines, according to the conditions obtaining in the particular colony or dominion.

We are convinced that direct agencies with enterprising and responsible firms can be arranged in practically every town or district of importance; but the "spares" problem has to be dealt with on broad and generous lines, and this seems to demand either a central distributing depot run by the manufacturing firm concerned, as, for example, one established in Melbourne to supply all agents in Australasia, or the recognition of a wholesale distributing house such as Mr. J. B. Clarkson's; but, in either case, there must be better control over ultimate selling prices, better service, and readier recognition of the needs of our Overseas buyers.

It is now in a very special sense a time of true Empire-building. May we once again urge upon the motor cycle industry the importance of getting together now to consider how best they can contribute their share to the cementing thereof by the improvement and extension of trade relations and the securing of the markets which lie open to them.

### THE TRAILER AMBULANCE.

Motor cycle ambulance trailer, forming part of a gift of Australian citizens for their Expeditionary Force. The bicycle is an Indian, and the trailer has accommodation for two wounded men. Though successful under favourable conditions, the practicability of a heavy solo bicycle towing a trailer under road conditions such as rule in the French war zone in winter is doubtful. The sidecar ambulance will, we consider, prove far preferable, and has, indeed, proved its worth already.

### INDIAN PRESIDENT RESIGNS.

It is stated that Mr. George M. Hendee has resigned his post as president of the Hendee Manufacturing Co. He is the biggest trade man in the United States, and his name is almost as well known in England. Mr. Hendee is 50 years of age next September, and established the present Hendee Manufacturing Co., the designer of the original Indian being Oscar Hedstrom.

# HORSE-POWER TESTS OF MOTOR CYCLES.

How the Available Power at the Rear Wheel may be Ascertained.

RECENT events have directed the attention of motor cyclists very forcibly and disagreeably to the topic of horse-power ratings, and in particular to that aspect of the question which deals with the calculation of power for taxation purposes, now happily at an end. In this article, however, a much less vexatious, and possibly a more interesting, branch of the subject will be discussed, and yet it is one of which the ordinary rider—or anyone else, for that matter—knows remarkably little: it is the measurement of the actual horse-power delivered to the back wheel of a motor cycle, that is, the net power available for propelling the machine. After all, that is the important figure from the rider's standpoint, because on it depend the speed that can be attained on the level and the limiting gradient that can be ascended.

Bench tests are useful in their way, and it is doubtless very impressive to be told that your  $3\frac{1}{2}$  h.p. engine has developed 8 h.p. or 10 h.p. under workshop conditions, but unfortunately such tests are of little value in our present quest. For, when the engine is assembled in the completed machine, how are we to know how much of the power then generated is dissipated in overcoming the resistance of belts, in losses due to faulty alignment, or in grinding the teeth of the gears? In fact, the ideal solution of the problem would be some sort of apparatus on to which any rider could wheel his motor cycle straight from the road, start the engine, and read off on a scale the h.p. delivered at the back wheel, with as little trouble as he reads off his own avoirdupois on a "Try-your-weight" machine on a station platform.

## The Sporting Method.

Contrast this tempting if fanciful proposal with the customary method actually employed for estimating the relative nett or effective horse-power of different machines, and of selecting the one in which, for a given cylinder capacity, the greatest power is transmitted to the rear wheel. The competing motor cycles, together with an army of riders, attendants, and spectators, are shipped across a (usually) tempestuous sea, and dumped on to a mountainous island, the inhabitants whereof are deprived of the use of their roads in order that the machines may career madly round and round a specified route for a stated number of times. After various calculations have been performed, one of the motor cycles is adjudged the winner, the details of its performance being vehemently thrust on the public notice by its gratified makers for many months afterwards.

Granted that this is a very one-sided picture of the T.T. race; that it is a test of the riders as much as of the machines; that the sporting element of the trial is a powerful attraction; and that it is contrived to test the reliability as well as the power of the machines; yet the solid fact remains that one of the chief objects of the contest is to select the motor cycle with the highest overall efficiency. The elaborate restrictions imposed by the promoters to ensure that all competing machines run as nearly as possible under identical conditions leave no room for doubt on this point. From this aspect, then, does there not seem

a certain waste of energy about the proceedings? "But it's the only way," you say. It may be the only way that has been tried, but surely it is not the only conceivable plan.

## An Alternative Suggestion.

Here is a suggestion for an alternative method. In your visits to the theatre or music hall you have probably witnessed exciting spectacles in which cavalry charges or motor car elopements are represented; the legs of the horses or the wheels of the cars, as the case may be, are indisputably in vigorous motion, and yet the animals or the vehicles to which they respectively belong make no progress whatever across the stage. Why? Simply because, instead of the road being stationary and the traffic in motion, the traffic is at rest relatively to the proscenium opening ("proscenium opening" is, I believe, the correct term), while the road moves, the road in this instance consisting of an endless band. Now suppose we anchor a motor cycle above this travelling band, and allow the back wheel to do the work of pushing the

Fig. 1.—Diagrammatic sketch of dynamometer.

roadway behind it; then by observing the speed of the wheel, and the thrust exerted on the "road," the effective horse-power becomes immediately calculable.

Perhaps a few general remarks on the question of the measurement of power may here be usefully interpolated, for the average motor cyclist is very naturally more familiar with the connection between cylinder capacity and horse-power than with the fundamental principles of this branch of mechanics. Power is defined as the rate of doing work, hence to ascertain the power exerted by an engine or motor we must measure how much work it performs in a given time. Since work (in the technical sense) is the product of force and distance, it follows that the measurement of power involves observations of force, distance, and time, or, what comes to the same thing, of force and speed. The unit of power is the horse-power; one horse-power is said to be exerted when 33,000 foot-pounds of work are done per minute. To calculate the horse-power of any source of energy, therefore, we must divide the number of foot-pounds of work done per minute by 33,000. In the case of a motor cycle, there is no difficulty in measuring the speed; the trouble occurs when the other factor, force, has to be evaluated. The force whose value we require to know is the "tractive force," i.e., the thrust that the back wheel exerts on the road.

**Horse-power Tests of Motor Cycles.—**

Let us now see how the travelling band arrangement will assist us in this respect. Essentially all that is needed is a roller or drum, as shown in the diagram fig. 1—the band itself may be abandoned (Sorry! that really was quite unintentional). Mounted on the same shaft as the roller is a brake drum by which the power of the engine is absorbed, while a spring balance measures the actual value of the tractive force. Assuming the machine under test to be fitted with a rear-driven speedometer, and that this registers a speed of  $S$  miles per hour, while the balance reading is  $W$  lbs., then the requisite nett or effective horse-power will be given by the expression

$$\text{H.P.} = \frac{\text{Work done per minute}}{33,000}$$

$$= \frac{\text{Force (lb.)} \times \text{Speed (ft. per min.)}}{33,000} = \frac{W \times \frac{S \times 5,280}{60}}{33,000} = \frac{WS}{375}$$

Although such an apparatus scarcely fulfils the ideal we had before us, yet its convenience and utility certainly seem to render it worth more than a passing thought. Imagine some enterprising garage proprietor to have constructed a testing machine or "dynamometer" on the lines suggested (it ought not

Fig. 2.—Alternative arrangement of dynamometer.

to be a very costly business), and some equally wide-awake rider to have taken his motor cycle to undergo a test. To fix the machine in position is the work of a few moments, and in quite a short time the engine can be running under any desired conditions—say, to represent a run at 25 m.p.h., with a specified throttle opening. The power being noted, the conditions may be slightly altered—a larger jet fitted, for instance—and another set of readings taken to observe the effect. In a similar fashion the influence of every possible kind of adjustment may be accurately determined; no matter whether it is the fuel, the timing, the carburetter, or the magneto that is altered, the corresponding increase or decrease in speed or power will at once be apparent.

**Useful for Tuning Purposes.**

It is hardly necessary to emphasise the ease and certainty with which an engine could be tuned by the use of a plant of this description. In tuning by ordinary methods it is often difficult to ensure that after each adjustment the trial runs are made under identical conditions. Thus, you find that with a certain brand of fuel you can traverse such and such a route with an expenditure of so many gallons, while with some other brand you require half a gallon more fuel.

But if the first run was made with dry roads and a following wind, while during the second you had to contend with rain and a head wind, who is to say which is the more economical fuel? All such doubtful factors are eliminated in the present proposal. This apparatus should also yield particularly valuable information on such questions as the relative power losses entailed in all chain, chain-cum-belt, and belt transmission, and in the various speeds of a gear box.

It is not my intention to enter into the constructional details of the apparatus, but one or two of the more salient practical objections may be dealt with. It is manifestly essential in the arrangement shown in fig. 1 that the centre of the motor cycle wheel should be vertically above that of the rotating drum, and owing to the unavoidable vibrations of the spring balance, this condition might be somewhat difficult to fulfil. Such a contingency could be guarded against by substituting a rigid link for the spring balance, the load being measured by a pair of balances acting on the brake drum. The apparatus would then take the form shown diagrammatically in fig. 2, but the principle is unaltered, as the tractive effort  $W$  is given by the difference of the balance readings (provided, of course, that the brake drum is the same diameter as the drum on which the motor cycle wheel rests). Some kind of fan for cooling the engine during long trials is obviously indispensable, as also might be a water-cooling device for the brake drum, but the provision of these ought not to tax unduly the ingenuity of any capable mechanic.

**A Second Arrangement.**

In any case, the brake drum is by no means an essential part of the equipment; the power generated by the motor cycle engine may be absorbed and measured in any other convenient manner. Thus, the roller or drum in fig. 1 may be coupled to a dynamo, and the power deducted from volt and ammeter readings. One final point: if the arrangement shown in fig. 2 be adopted, the revolving drum must be mounted on ball bearings, otherwise the journal friction will impair the accuracy of the tests. The small, almost negligible, friction offered by ball bearings will, to all intents and purposes, compensate for that with which we are crediting the motor cycle on account of the front wheel being stationary. In other words, since our object is to reproduce as completely as possible the conditions under which the machine normally runs, the front wheel as well as the back ought, strictly speaking, to be in motion; and the work performed by the engine under test in rotating the drum (*i.e.*, in overcoming the journal friction) is roughly equivalent to that which it would do on the road in turning the front wheel.

To meet the murmurs of those who resent the intrusion of mechanical methods into fields in which a happy-go-lucky sporting element has hitherto predominated, let me explain that it is not suggested for an instant that the proposed testing apparatus should or could do anything more than *supplement* existing processes. At the same time, it may be permissible to remark that if you are out for sport, then have as many and as sensational races as ever you like; but if your intention is to judge the merits of a motor cycle regarded as an engineering product, then test it in a scientific way.

"MOHANDIS."

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Failure to Run Slowly.

**?** I use a 5-6 h.p. single-cylinder 1914 model motor cycle fitted with Senspray carburetter, and although the machine is running perfectly I cannot get it to run slowly. The engine will not fire regularly until the throttle is opened a bit, and this trouble is tiresome when in traffic. I use a 46 jet, and the carburetter, etc., is quite clean, the plug points are set correctly, and the platinum points are also right. The carbon brush of the magneto has been cleaned, and still the engine will not run slowly. Would the petrol level in float chamber being too low cause the trouble?—E.R.A.

This trouble is nearly always due to air leaks at the carburetter or induction pipe unions, or to too small a jet. We should say that the petrol level might have some effect on the matter.

## Driving a Two-stroke.

**?** (1.) What is the correct method of descending a hill on my 1914 model 2½ h.p. two-stroke motor cycle? I usually leave the air lever fully open, and close the gas lever, letting the compression act as a brake. When this slows the engine down too much, I open the gas lever for a period of ten yards and close again, then open and so on. Is this correct? (2.) I rarely use the compression lever (except for starting), but when I do lift it, going down a hill, there is a distinct rattle. Is this a sign that the piston is a bad fit in the cylinder? (3.) How often should I drain the crank case? (4.) What is the best method of judging the correct size of jet to use, just for ordinary town and country riding? (5.) What packing should I use for the joint between the cylinder and the exhaust port? There is a slight gap on the underside of the joint.—J.W.H.

(1.) Your method is correct, except that the air lever might be drawn back to meet the throttle, and so provide a reduced charge. (2.) This rattle usually takes place in a two-stroke if it has been running for some time. It does not necessarily mean that the piston is a bad fit in the cylinder. It may be that one of the rings is gummed up. (3.) Once every five hundred miles. (4.) You can find the best method of judging the correct size of the jet by working down from a large size—say 32—until you get the correct size with which the machine runs best, when it will neither choke up nor miss at speed. (5.) We should say asbestos or Hallite packing.

## Correct Lubrication.

**?** I have a 2½ h.p. four-stroke, and I do not seem able to make the exhaust smoke unless I give about four or five pumpfuls of oil. I should be obliged if you could say if it is any the worse for this.—P.N.

It is no fault that you are unable to make your engine smoke, provided that you are sure the full pumpful of oil is actually being delivered to the crank case, and not being simply pumped back into the tank. If the piston is a good fit it is often possible to give several pumpfuls of oil without causing smoke to issue from the exhaust.

## IMPORTANT NOTICE.

### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD

## Testing for Overheating.

**?** I have a 1912 3½ h.p., which, after I had ridden it about forty miles, was very hot and refused to pull up hills. I took it to a garage and had it rebushed and new rings fitted, but still it gets extremely hot in about two hundred yards—too hot to bear the hand on the cylinder—and the crank case also gets very hot. The engine stops as soon as ever I give it more air than gas. I have tried three different jets from 28-30, and I believe the old one is a 32, and still I cannot get the engine to take extra air. I have had the cylinder off, and the engine seems quite clear in every way.—A.B.

Placing the hand on or near the cylinder is not the correct way to test for overheating. You can never bear the hand on the cylinder of any air-cooled engine. If the engine runs well, and does not either lose power or pre-ignite, you need not worry about bearing your hand on the cylinder. Refusal to take air is due either to too small a jet or an air leak between the carburetter and engine. Provided you are able to give a certain amount of extra air, it does not matter about the refusal to take more air than throttle opening.

## Petrol Permit not Transferable.

**?** I shall be greatly obliged if you can give me information on the following point. I imagine it may be of interest to others of your readers also: If the owner of a motor cycle lends his machine to a friend, can the friend use the owner's petrol permit?—N.L.M.

The point you raise is of very considerable interest to all motor cyclists, and we have approached the Petrol Committee for a definite ruling. We are informed by the committee that the petrol licences are strictly non-transferable, so that, in your case, it will be impossible for you to borrow your friend's licence as well as his machine.

## Lamp Regulations.

**?** I propose making my lamp fixed by soldering it well. Will this comply with the regulations? I have one coat of aluminium paint on the glass. Is this sufficient for Northants. area?—J.S.F.

You should really have your lamp secured by means of two stout rivets either instead of or in addition to the solder in order fully to comply with the rules. We think, in most instances, soldering, provided it was really well sweated up, would satisfy the police. In a police court recently a magistrate stated that soldering was not sufficient, although we understand that Messrs. Joseph Lucas were informed by the authorities that soft soldering was sufficient to comply with the regulations. One sheet of tissue paper over the glass is all that is needed in Northamptonshire. The paint is quite all right also.

## Preserving a Rubber Belt.

**?** While home on leave recently I bought a new Dunlop belt for my 2½ h.p. Premier, but, being stationed a considerable distance from home, it is very difficult to get leave long enough to allow of any motor cycling, and, consequently, the machine is standing idle. Can you tell me the best method of preserving the belt, as a dealer tells me that a belt will perish a great deal sooner if not used than if employed regularly every day? Also, do the tyres perish if constantly pumped up?—A.M.B.

The belt would be best preserved if removed from the pulleys and put away in a dark, cool, damp place. It should not be rolled up tightly. The tyres should be blown up hard, the machine jacked off the ground, and kept in a dark, cool place also. Rubber goods perish more rapidly when not in use.

**Does Motor Cycling cause Neuritis?**

**Q.** Having just spent seven weeks in bed owing to an attack of neuritis in the right leg, and as my medical adviser seems to lay the blame on motor cycling, I should esteem it a favour if you would let me have your valuable opinion as to whether it might be set up by that most enjoyable and, to my mind, health-giving sport.—R.L.

We do not think that neuritis is a complaint that can often be properly laid to the door of the motor cycle; but probably, in the event of excessive vibration being conveyed by any means to the joints of an individual who is constitutionally inclined to suffer from this complaint, an ill effect would be produced by continuous use of a motor cycle. We would suggest that you reduce your riding for the time being to a minimum, and observe whether or not the neuritis disappears.

**Clanking Noise.**

**Q.** I have a 3½ h.p. single-geared machine which heats very quickly. When cold the engine starts quite well, but if I start when hot it develops a clanking noise until I get up a good speed, then it disappears again. The same thing occurs when I raise the exhaust lever or close air and throttle levers to run slowly. I have examined the connecting rod to see if there is any play in the bushes, but it seems all right.—N.

Provided all the bearings are in good condition and are without up and down play, the most likely cause of the clanking noise is as follows: Ignition too far advanced; the spark should be timed so that it occurs when the piston is on dead centre with the ignition lever about half advanced. Pre-ignition, due to excessive carbon deposit or a plug which has unsuitable electrodes, might be the cause.

**Valve Breaking.**

**Q.** Can you tell me whether there is anything in the method of driving motor cycles which is conducive to the breaking of valves?—W.H.U.

Driving all-out at high engine speeds tends to the breaking of valves, while careful driving well within the power of the machine has the opposite effect.

**Using Engine as Brake.**

**Q.** I wish to fit a magneto cut-out switch to my 2½ h.p. New Imperial-Jap motor cycle, because I believe the braking power of the compression is considerable. Is there anything against its use? Kindly mention method of wiring. Does a decompressor really fulfil all the functions that it is said to do?—E.C.

The compression does not really act as a brake at all; it has simply a cushioning effect. It requires a certain amount of resistance to overcome, but when overcome the spring back is equal to the previous resistance. As regards a cut-out switch. You may fit one of these by all means. All you have to do is to order from the makers of your magneto a contact breaker cover with a switch terminal fitted—that is to say, if there is not a switch terminal already fitted. The wiring is the simplest thing in the world. You simply take a low-tension wire from the switch to the terminal on the magneto. A decompressor is a device for reducing the compression in the cylinder. It certainly accomplishes this function, and assists starting with single-cylinder engines in particular.

In our issue of August 3rd, a reader, in paying testimony to I.P.C. belt grip, mentioned the old address of the firm. The correct address is the Increased Power Co., Ltd., 7, Southwark Street, London Bridge, S.E.

## A Motor Cyclist with General Smuts.

Some Experiences with a Light Armoured Motor Battery in German East Africa.

THE Editor has received a very interesting letter from one of the drivers in a Light Armoured Motor Battery, the men of which he enlisted, and which is now operating in German East Africa. His communication is appended, after being passed by the British Press Censor:

"I do not suppose that you can call me to memory among the thousands of your recruits, but as a guide I may say that I did some articles for you in 'civvy' life, 'Some Notes for Fast Tourists,' about a year ago, and used to belong to the M.M.V.C.

"At Bisley I used to drive the old box body Napier from September until January last, and then came out here driving one of the ammunition lorries for this armoured car battery. In turn I have driven Fords, was a scout on a Douglas, and then, as the other men went sick, eventually became driver on No. 3 armoured car, which I took up to Kondoa Irangi.

"I expect you are more interested in bicycles than cars, and so will try and keep off the hopelessness of the low built English cars as compared with the generous clearances of the Yanks and suchlike copy for your sister journal, *The Autocar*.

### Stripped Motor Cycles.

"Our battery tried to move up with the foot and horse in the rainy season, and naturally found the thick black mud its master. The front mudguards of the Douglases clogged up very quickly, and so were cut away at the bottom stays. Our scouts were practically allowed to do anything they liked to the machines, and so very soon they were stripped down à la Brooklands, because the fellows did not relish hauling unnecessary weight through the swamps. When the Napier ammunition lorry was abandoned on the side of the road the machine I took over had no front mudguard, the spares box and carrier were missing, back mudguard cut away at the saddle, all accessories except pump gone, as were front shield and stand, and the only tools and spares were in the pannier strapped to the lamp bracket.

"The drifts, often two feet deep and quite rapid, gave the scouts a lot of trouble. Those budding speed fiends who had removed the ends of their silencers were very often rather surprised to find that their less noisy companions rode through the shallower streams without

trouble, whereas their own engines dried up through choked exhaust gases.

### Where Colonial Experience Scores.

"It is interesting to note that two Australians who had come over to join the M.M.G.S. very quickly showed up when any rough riding or bad mud holes were met. Although generally sighing for big twin machines, they soon showed that very different tactics are necessary Overseas from those followed at home. We quickly found that the only way to get across a bad patch of thick mud is to rush it all out, and let the impetus carry the machine as far as it will. Then pick the bicycle up and walk with it (if possible) on to dry ground!

### "THE MOTOR CYCLE" AND THE SERVICES.

Mainly, no doubt, on account of the fact that "THE MOTOR CYCLE" has interested itself in motor cyclists joining one or other of the Services, we are regular recipients of communications from all the different war zones. We appreciate these accounts, written to us quite spontaneously, and know from experience that they are of absorbing interest to fellow riders in the Services or those engaged upon war work at home.

During the last few months experiences of motor cyclists in Mesopotamia, the Cameroons, Macedonia, India, Egypt, and German East Africa, not to speak of the fighting fronts nearer home, have appeared in these pages. Among the writers are airmen, lorry drivers, despatch riders, and men in one or other of the combatant sections.

We intend continuing to publish extracts from accounts of experiences received, in our Military pages, to maintain for "THE MOTOR CYCLE" its position as the Journal of the Services.

"When the roads dried they were just like a frozen ploughed field, and why the frames did not break I do not know. We had a lot of trouble with the footrests breaking. The fellows simply could not sit on the saddles over the dried up swamps, and had to use their bent legs as shock absorbers. You can judge what the roads were like when my car broke up three twin wire wheels in eighty miles!

### Motor Cycle Infantrymen.

"All the same, the 'Dugs' are wonderful little machines, and if the South African infantrymen stick to their word

Douglas Bros. should have a huge sale in South Africa when the war is over and normal times return.

"As I daresay you know, there are motor cyclists mounted on B.S.A.'s out here. They did a splendid run up across country in the dry weather to Kondoa. The men carry absolutely everything—arms, tent, bedding, and cooking outfits on the machines, and the way those B.S.A.'s are standing up to the rotten roads and the huge loads is a revelation to all. The only trouble is in the low magneto position and rather small ground clearance. The R.F.C. P. and M.'s are also plugging away very staunchly.

### Suggested Overseas Design.

"If I were designing a machine for Overseas I think I should have a 5-6 h.p. low compression twin, with magneto and silencer placed as on the countershaft Zeniths; a loop frame of very heavy gauge tubing, 28 x 3in. wheels, three-speed countershaft gear box, with belt-cum-chain drive, and plenty of clearance, both ground and mudguard. The latter could very well be flat or slightly domed shields 2 1/2in. from the tyre, and the clutch must be H.B.C.

"The South Africans are an awfully sporting set of men, and if only the English manufacturers had given them decent, polite attention, and studied their wants, there would be more money in Coventry and less in the U.S.A. Practically all of the younger men are hoping to buy motor cycles after the war, and, as I said before, the performances of the English machines out here have certainly impressed them very favourably. A good British spring frame machine would sell like hot cakes.

"Well, this is getting lengthy, but when in hospital, away from the boys and excitement, time hangs somewhat. I have had four attacks of malaria, and am convalescent up back at the base, Nairobi. I would give pounds for a few copies of your paper.

"W. MILES WEBSTER-THOMAS."

### A RECORD BREAKER IN FRANCE.

SYDNEY GEORGE, the well-known exponent of an Indian and holder of the record for the fastest speed on a motor bicycle on a British track, is now a despatch rider in the R.F.C. He is now mounted on a P. and M., and is now in France, where he has been for some time. The faithful machine he rides has carried him 30,000 miles, and he informs us he has never had the cylinder off. This, we should imagine, is another record to his credit, and to that of the machine he rides.

# Dynamo Lighting for Motor Cycles.

## C.A.V. DEVELOPMENTS.

AN after the war development of the motor cycle that is as certain as day following night will be the great popularity of electric lighting. We refer in particular to dynamo outfits, though it is admitted that there will always be a field for the storage battery equipment.

At the outbreak of war 75% of new cars were fitted with dynamo sets as

Location of switches inside sidecar (bicycle side) of C.A.V. dynamo lighting set.

standard, but as regards motor cycles the same stage had not been reached, and only a small percentage of the machines on the road were so equipped. However, one or two firms had standardised excellent sets for sidecar outfits, and since the war commenced other electrical firms have been experimenting likewise.

### Small Car Dynamo.

For instance, C. A. Vandervell and Co., Ltd., whose name is a household word in connection with electric equipment, have already made preparations for marketing a motor cycle dynamo set after the war. As a matter of fact, the firm are in a position to supply and fit at their Stanhope Street Works, Birmingham, a

limited number of sets in which a C.A.V. model "D6" small car dynamo is used. It is adjusted to give a reduced output, and the set is a very satisfactory substitute.

Mr. D. Elyard Brown, of the C.A.V. Co., has his Norton sidecar equipped with one of these dynamos, and so far he has covered about 4,000 miles. With this particular outfit there is a bracket for the head lamp allowing of several different positions for the lamp. The latter is so fixed that the front is slightly behind the bars. The dynamo is fitted to a special bracket on the left of the bicycle, that is to say, between the bicycle and sidecar, and driven from the engine-shaft by a Whittle belt. A feature of the equipment is a small speedometer light, which has a shutter enabling the light to be directed exactly where it is wanted. The usual sidecar and tail lamps complete the equipment, not forgetting the batteries that are located in the sidecar.

### A New Searchlight.

We also illustrate a C.A.V. searchlight. It is run from a dynamo, interchangeable, and identical in appearance with that shown fitted to the Norton, but specially wound to give the necessary output for starting and working the tungsten arc with which the searchlight is fitted, or alternatively charging a battery for a wireless installation, or working a heater circuit.

Searchlight-equipped sidecar. The electrical equipment is C.A.V., and the dynamo is located on a special bracket above the left-hand footboard of the bicycle and driven by the Norton engine

### EXPERIMENTAL DRUID FORKS.

THE Druid forks which we illustrate herewith differ from the more usual type only in the position of the springs. The attachment to the fork blades is the same as before, but the tops of the springs are fixed to a special

Latest pattern Druid fork, which is located above the links instead of below, as in previous models.

bracket which forms the top part of the steering head. A patent for this adaptation has been granted to the legal representatives of Arthur Drew (deceased), No. 11,006/1915.

Mr. D. Elyard Brown, a director of C. A. Vandervell and Co., Ltd., and his dynamo lighted Norton sidecar. Mr. Brown is one of the oldest members of the M.C.C.

## TIMES TO LIGHT LAMPS.

	"SUMMER" TIME.	
Aug. 24th .. ..	8.34 p.m.	
" 26th .. ..	8.30 "	
" 28th .. ..	8.26 "	
" 30th .. ..	8.22 "	

## Following the Panama Canal.

The Panama Isthmus has been crossed for the first time by two motor cyclists on a Harley-Davidson sidecar. Twenty-five miles of the trip had to be covered on the railway sleepers.

## Across Canada by Motor Cycle.

Runs by motor cyclists and car drivers across the United States from Atlantic to Pacific, and *vice versa*, are not at all uncommon. So far, however, a similar run across Canada has not been made, though it has been attempted by a motorist, who was finally compelled to use the railway. Now President F. A. O. Johnston, of the Canada Motor Cyclists' Association, suggests that a keen motor cyclist could make a name for himself by a run from ocean to ocean through the wide plains, roadless forests, and mountain ranges of the Dominion. The distance, roughly, is 4,000 miles

## Thermo-cooling.

A reader, who signs himself "Theorist," but points out that he is neither engineer nor mechanic, suggests that the cylinder of a motor cycle could be cooled by means of a vacuum jacket surrounding it on the principle of the Thermos flask. This is the first time that we have heard that a cylinder can be cooled by retaining the heat in it.

## No Petrol for Joy Chars-a-bancs.

In criticising the allocation of petrol to motor cyclists, we and our readers have drawn attention to the large numbers of chars-a-bancs throughout the country that are used for joy rides pure and simple, though the vehicles are classed as commercial vehicles. Consequently, we were not altogether sorry to see that official steps have been taken to forbid from September 1st the use of motor spirit in chars-a-bancs used for pleasure purposes. Chars-a-bancs used in connection with ambulance or hospital work, naval, military, and munition service, conveyance of munition workers to and from work, and services certified as being desirable in the interests of the travelling public will not be affected by the new regulations.

## SPECIAL FEATURES.

**A MOTOR CYCLIST WITH GENERAL SMUTS' HORSE-POWER TESTS (illus.).**  
**MY FIRST WEEK AS A MOTOR CYCLIST (illus.).**

## Petrol for Road Surveyors.

There does not appear to be much prospect at the moment of road surveyors who use motor cycles for business of receiving special consideration from the Petrol Control Committee. Mr. Harcourt announces that at present it has not been found practicable to make any special arrangements for such users, though chief constables have been informed that they will have plenty of petrol. If chief constables, why not county and road surveyors?

## Petrol Permits Again.

A correspondent writes: "Two cases I know of, both in the same business. One man runs a Ford van, motor cycle and sidecar, also stationary engine, all in connection with his business, and is allowed 78 gallons for three months, six gallons of it only for motor cycle. In the other case, which is a smaller business, the man runs only a Ford van, and is allowed 144 gallons for the three months."

REIGATE WOUNDED SOLDIERS SIDECAR RUN. (See next page.)  
 Some of the sidecars at Cobham.

**The Sgt. Hubbard Fund.**

Some little time ago we announced that a fund had been opened in aid of the widow and children of the late Sgt. Hubbard, R.E. Mr. A. W. Thrush, of Erdington, Birmingham, now informs us that he has collected the sum of £18 19s., which he has handed to Mrs. Hubbard, and for which she was very grateful. The sum was contributed as follows:

F. A. Newlands, M.P., £2; W. Egginton, £2 2s.; H. Reubin, £2; S. K. Jones, £1 13s.; A. W. Thrush, £1 5s.; A. E. Ansell, £1 1s.; Chas. Alder, £1 1s.; J. Rollason, £1 1s.; Alec Ross, 10s. 6d.; E. H. Bayliss, 10s. 6d.; N. Maxfield, 10s.; O. H. Wethered, 10s.; T. Coggins, 10s.; A. Butterfield, 10s.; H. Sharpe, 5s. 6d.; G. Jones, 5s.; C. Cadby, 5s.; C. Allerton, 5s.; H. Jones, 5s.; F. Whitworth, 5s.; V. C. Horrolo, 5s.; W. G. Jones, 5s.; E. A. Walter, 5s.; E. Johnson, 5s.; P. Beddoes, 2s. 6d.; F. Bowers, 2s. 6d.; C. Bowers, 5s.; S. A. Newman, 2s. 6d.; G. C. Knox, 2s. 6d.; S. Hall, 2s. 6d.; H. Lees, 2s. 6d.; S. Jones, 2s. 6d.; W. Lee, 1s.; H. Wimbush, 1s. Total, £18 19s.

**Still Plenty of Fuel.**

Hardly any appreciable difference is yet to be noted in the number of motor cyclists on the main roads in the vicinity of the large towns. It is only when a long run is made that the small number of motor vehicles of all kinds is observed. With the help of substitutes and private stocks of petrol, most riders are finding it possible to indulge in week-end runs, at least.

**Admiral Arbuthnot Trophy Fund.**

This fund has, since the last list was published in our issue of August 17th, been brought up to the total of £106 13s. by the following subscriptions:

Messrs. Douglas Bros. . . . .	£5	5	0
F. G. Short, Esq. . . . .	5	5	0
Zenith Motors, Ltd. . . . .	2	2	0
Lt. C. B. Barry . . . . .	1	1	0
H. A. Howse, Esq. . . . .	2	6	

**More Summonses for Movable Lamps in Buckinghamshire.**

We continue to hear of cases of convictions of motor cyclists under the Defence of the Realm Act for using motor cycles fitted with swivelling or movable lamps. Apparently it makes no difference whether the rider is stopped in the daytime or at night; in fact, all the cases we have heard of the rider has been stopped in daylight. The fines have ranged from 10s to £2 and the lamp confiscated. Both these cases were in the same court, the higher fine being in the case of a War Office machine. It is interesting to note that practically all War Office machines that have been turned out are equipped with Lucas King of the Road head lamps, and which are capable of movement independent of the machine. This regulation is a most absurd one when seriously considered, for what is easier, should a motor cyclist wish to signal, then to remove the lamp bodily from the machine, which, in the case of a back socket lamp, only entails the loosening of one nut, and flashing the lamp about in his hands to his heart's content? This would really be much easier than moving a lamp fixed on a swivel on the machine.

**Still they come.**

Four further petrol substitutes recently introduced are Force, Arbeco, Relico, and Lightning. This brings the number of substitutes to sixteen, so that, with paraffin, motor cyclists need not seriously curtail their riding. The *Daily Mail* might note this fact, and allow war workers to enjoy peacefully what little recreation they get.

**The National War Funds.**

At the week-end the principal relief funds stood as follow:

The Prince of Wales's National Relief Fund (£3,443,250 distributed) . . . . .	£5,943,295	0	0
British Red Cross Fund . . . . .	4,193,008	0	0
Tobacco Fund . . . . .	112,430	3	4
The Kitchener National Memorial Fund . . . . .	237,500	0	0

**Paraffin with a Two-stroke.**

The Villiers Engineering Co. recommend riders of two-stroke engines, who wish to run on paraffin, to fill their main tanks with this fuel, combined with the usual proportion (one to sixteen) of oil, and to put petrol and a little oil into the

Using paraffin in a Villiers engine.

oil tank. Both tanks are then connected with the carburettor, and the procedure is now as usual, viz., start on petrol, when the engine is warm turn on the paraffin, before stopping turn off the paraffin, and turn on the petrol again to ensure an easy start next time.

**The Boys at the "Wisley Hut."**

Some forty wounded soldiers from two of the local Red Cross hospitals were taken recently by the Reigate tradesmen in sidecars representing almost every well-known make, with a sprinkling of cars. All went away in good style at 2.30 in the afternoon, and after a delightful run through the most picturesque of Surrey scenery the party arrived at the famous "Hut," situated in its glorious and health-giving surroundings of pine woods. Here the boys certainly enjoyed themselves, at once taking to the boats which the worthy proprietor of the Hut, Mr. Pullen, placed at their disposal. A muster of seventy odd sat down to tea. All proclaimed the run "great," and hoped that it was but the forerunner of many more expeditions of the same kind.

**Paraffin in the Cold.**

When the necessity for using some other fuel than petrol first arose the weather was hot, and many were the enthusiastic experimenters with vaporisers and heavy fuels, and wonderful were the results. "Absolutely no difference from petrol," and so on, were the remarks, but we fear that as the cold weather comes on the disappointments will be many. We made a run in the cold early hours recently, using pure paraffin. The result was power non-existent, and misfiring the order of the day.

**Proposed Outing for Wounded Soldiers and Sailors.**

No outing has yet been arranged for the wounded at West Ham Hospital. All readers who are able to co-operate in such an undertaking are asked, therefore, to communicate at once with Mr. Stephen S. Crouch, 140, Belgrave Road, Wanstead. If sufficient support is forthcoming, a committee will be formed and the necessary arrangements made.

**YET ANOTHER MOTOR CYCLIST AIRMAN.**

Lieut. I. B. Hart-Davies, R.F.C., who, in spite of his age—he is 39 next birthday—obtained his "wings" last week. He is doubtless one of the oldest pilots to obtain their "wings" during the war. Only a few readers will need reminding that Hart-Davies is an ardent motor cyclist, and holder of the End-to-end record on both motor cycle and light car. It will be noted that he is still faithful to the Triumph, on which make he made one of his End-to-end records.

# THE LIGHTWEIGHT MACHINE FOR THE COMMERCIAL TRAVELLER.

**T**WELVE months ago I came to the conclusion that there was a lot of good prospective business which I could not profitably reach by train. Not many commercials can afford half a day to make one or two calls, and there are many villages which cannot be reached in less time. When the war broke out my business looked like suffering, and I felt that it was time to make some effort to extend it, and a motor cycle seemed to be the best means to this end. I went carefully into the whole matter, and mapped out a series of weekly tours, yielding from fifty to eighty prospects per week. Though never previously of a mechanical turn of mind, I "read up," and sought the acquaintance of motor cyclists. My available cash was about £40, and, being a novice, I felt it expedient to buy a new machine rather than a second-hand one. So that I was limited to the choice of a lightweight, and eventually decided on the O.K. Junior, 2 h.p. And, diverting a moment from my subject, I should just like to say here that the O.K. has given me splendid service so far, and carried me—and my ugly but necessary luggage—up some fearful hills. I have only ridden eight miles in a train during the last six weeks, but have averaged 250 miles per week on the bicycle during that period, and, moreover, I have made 24% more calls than I set out to do, for I found time to branch off my main route first on my left and then to another village on my right.

## • My Itinerary.

Perhaps the districts worked will interest other commercials thinking of buying a motor cycle for business purposes only. One week's tour takes me (from Birmingham) through Coventry to Rugby, Market Harborough, Kettering (for Monday night); Tuesday I spend in the Northants villages between Kettering and St. Neots (Hunts.); Wednesday between St. Neots and Bedford; Thursday to Bucks County (overnight at Stony Stratford), and then working home to Birmingham on the Friday—292 miles in all. Another week I go round part of Shropshire, making about seventy calls between Bridgnorth, Ludlow, Shrewsbury,

Oswestry, Wellington, and home—about 250 miles. Another week is spent in some of the Worcester villages between Birmingham and the Malverns, then on to Ledbury and Gloucester. From Gloucester I go on to the Forest of Dean for three days, and find some terrible roads and hills for the little O.K. Those who know this district will agree that, after rain, these Forest roads are a very severe test for non-skid tyres, and, incidentally, have given me much confidence in the security of my carrier box. The climb—and "road"—from Lydbrook, past Joys Green, to Ruardean Hill is, I think, about the toughest proposition I have tackled so far. And it is not easy running

from Cinderford to Coleford. Then I have a week's work in the more scattered villages of North Staffordshire and the borders of Derbyshire, including Ashbourne, and three weeks' work in the Monmouth valleys.

At the outset I was up against the difficulty of carrying my bags—a business and a spare. I did not like the idea of strapping these things to the carrier (which would have meant leaving part of my stuff so

strapped whilst making calls). So I had a tin box built as a temporary fixture, 20in. x 12in. x 10in. high, and securely bolted to the carrier. The box is fitted with lock and key, and takes my two bags and a light rain-proof coat for evening wear. The photograph will give a good idea of the box, the bags being partly drawn out, of course. My coat folds over the top bag, thus making a tight fit, so that there is no movement whatever when on the road, and no shifting of weight. And I so arrange my stuff in the bags that the heavier stuff is near the saddle, and consequently little weight overhanging. I have had the carrier strengthened, and a supporting strap is used as a precaution against a possible fracture.

## Better than a Train.

As my calls are almost entirely "country" calls, I have found no difficulty in finding a place to leave my machine for half an hour or so whilst doing my business, and the locked box has so far secured me against petty pilfering.

A COMMERCIAL TRAVELLER'S LIGHTWEIGHT.

The machine is a 2 h.p. O.K. Junior, with chain-cum-belt transmission.  
Note the spacious case on the carrier.

**The Lightweight Machine for the Commercial Traveller.—**

Nine out of ten commercials "pass" a lot of good prospective business when they buy an 8s. 4d. railway ticket. The motor cycle costs less, and it certainly enables me to touch prospects I could not otherwise reach. And I am sure, at any rate during the spring and summer, one feels far better and more fit for work after three hours in the saddle than one does after such a period of train travelling.

The undesirable but necessary box which I have to carry, and the diminutive appearance of the engine on the O.K. Junior, have created much interest in business and "trade" circles, and I am frequently asked whether the weight I carry does not cause me to skid badly. I may have been fortunate, but I have never yet skidded when carrying the box aboard—though

twice when without it. I suppose this fact is against theory, but there it is, and, though anything but an expert rider, I have been over some bad roads, including the ride through Warrington and Wigan to Blackpool, and the greasy forest roads before mentioned.

In conclusion I can very strongly recommend any commercial traveller, say under fifty years of age, who may be anxious to open up new business, to try one of the reliable lightweights now offered. Let him approach the agents and tell them the purpose for which he desires the machine, have the carrier strengthened, be sure of good brakes and tyres, carry a few spares, and "Tracing Troubles." I feel confident the outlay could, in hundreds of cases, be made commercially profitable, and enjoyable too, as in my case.  
H.L.

## The 1916 2 $\frac{3}{4}$ h.p. Spring Frame Douglas.

### A FAST AND COMFORTABLE MACHINE.

I AM at present riding a sample of the latest 2 $\frac{3}{4}$  h.p. spring frame Douglas, which is a revelation in luxurious road travel. The type of springing should be familiar to readers from previous illustrations in *The Motor Cycle*. Long inverted semi-elliptics are pivoted centrally on the main frame; their fore ends are attached to brackets fixed to the middle rail of the frame under the tank, and the hinged rear frame rides on their tips. They allow plenty of movement, and the progress over really bad roads is devoid of shocks. Under moderate jars the rear frame rises and falls without the rider being conscious of its motion; under severe shocks the blows are eased, and the rider is conscious of a much gentler swaying than the average first-class front fork conveys.

In other respects the machine evinces mere detail improvements. The engine efficiency is higher than ever, and the speed, especially on hills, is astonishingly good. Starting is always easy with horizontal twins, and the wee Douglas, being a small engine for this pattern, is possibly the easiest starter on the market. It will start from stone cold at the first depression of the kick-starter, provided the air intake of the carburettor is covered; and it can always be paddled off in a yard or so on second gear when once warm. The bearings of the front fork links and of the rear spindle of the back frame springs are wisely equipped with screw greasers, and should wear much better than those patterns which are left to the mercy of oil helmets.

The detail work throughout is of good design and construction. The toolkit is designed and made specially for the machine, not ordered by the thousand from a tool maker without reference to the needs of the nuts and other parts requiring attention occasionally.

#### High Saddle Position.

The sole criticism I should offer is that the saddle is unduly high from the ground line (about 32in.). This high position has evidently been adopted as part of the spring frame design, and certainly affords a very comfortable upright position, without tending to make the rider hunch his shoulders. But the low

position is generally popular nowadays, and a rear-sprung machine of another make, with very similar rear-springing, shows a saddle height of no more than 26in. This low seat may tend towards round shoulders, but it is infinitely preferable when one stops, or is paddling the machine about. I should really advise the firm to drop the saddle 4in. or so for next season, and then they will have a mount possessing extreme comfort and all the handiness and controllability of the standard "Duggie."

ROAD RIDER.

Sidney George, a despatch rider in the R.F.C., mounted on a P. and M. This essentially touring mount is somewhat of a contrast to the monster eight-valve Indian on which he attained the remarkable speed of 93 m.p.h. at Brooklands. (See page 160.)

# "THE MOTOR CYCLE" RECRUITING SECTION.

M.M.G.S. Closed for the Time Being.

A GROUP of recruits attended at the Recruiting Office, Coventry, on Tuesday of last week for examination and enlistment into the Motor Machine Gun Service. The names of those motor cyclists and car drivers accepted are given below:

Ruckle, J. F., Stroud.  
Bullivant, G., Offchurch, Redditch.  
Butterfield, H., Barrowford, Lancs.  
Dowse, G., Osbournby, Lancs.  
Evans, C., Bradford.  
Ford, G. H., Tamworth.  
Foster, C. G., Norwich.  
Hewson, A. W., Coventry.  
Parkes, H. E., Oakengates.  
Sedgwick, E., Barrow-in-Furness.  
Sparkes, S. W., Coventry.  
Taylor, F., Coventry.  
William, E., Didsbury, Manchester.

Appointments with other candidates had been arranged for yesterday (Wednesday) at the offices of Messrs. Hiffe and Sons Ltd., Century Buildings, 199, Deansgate, Manchester, and on Tuesday next Mr. Geoffrey Smith will attend at the Recruiting Office, Coventry, at 2.30 p.m., in order to examine and accept suitable

Central Office for Motor Machine Gun  
Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

applicants. Only a limited number of men can be accepted at the latter inspection, as recruiting for this section has been closed. No men should attend unless they have received railway warrants. As soon as recruiting is re-opened notification will be made in this column.

Full particulars of enlistment and a form for filling-in purposes may be obtained on application, whilst the conditions of enlistment are mentioned on this page.

A free railway warrant will be issued to prospective recruits living at a distance if the applicant will previously get examined before the Medical Board for

his district and mention his class when applying.

The amended conditions of enlistment in the Motor Machine Gun Service are given hereunder:

EXPERIENCE.—At least one year's motor cycle or car driving experience.

AGE.—18 to 40.

ENLISTMENT.—For duration of the war.

MEDICALLY FIT.—For general service or for garrison duty abroad.

PAY.—1s. 2½d. per day, all found; the usual separation or dependants' allowance.

Among the candidates who presented themselves for enlistment at the Recruiting Office, Coventry, on Tuesday of last week, was a youth who produced his birth certificate showing him to be eighteen years of age that day, whilst another enthusiastic youth, who had travelled from Ulverston, had to be refused enlistment on account of age, which was given as 18½, but which proved to be 17½.

## MILITARY NOTES.

### QUITE A VETERAN!

THE man whose illustration accompanies this paragraph has had a varied experience since he joined the Army in the early part of October, 1914. L.-Cpl. H. Sargeant, the rider in question, is well known in Wimbledon motor cycling circles, and had been riding for eight years when war broke out. He found himself in France in the month

Lance-Cpl. H. Sargeant, who joined the Army in October, 1914, and has had a most varied experience since.

following that in which he joined, and he was attached to a field ambulance, riding a Douglas, for twelve months. Then he was transferred to a siege battery as despatch rider, his mount being a Triumph. After several months he was again transferred, and he is now driving a 3 ton lorry, but he says that he much prefers motor cycling.

### CANADIANS SIDECAR OUTING.

THE popularity of sidecar outings for convalescent soldiers has spread to Canada, and we hear that a Toronto agency has arranged an outing for men sent home from the firing line.

### A SIDECAR BUILT IN THE WAR ZONE.

SOME few months ago we illustrated two motor cycles that had been assembled behind the firing line in France. Now, through the courtesy of Art.-Cpl. P. J. Egerton, R.E., we are enabled to give some particulars and an illustration of a sidecar built by himself under similar conditions. The difficulties encountered must be experienced to be believed, and great ingenuity was displayed by Egerton.

The chassis was made from channel iron with the aid of a blacksmith's forge, and the body framework was sawn from a 6in. x 4in. beech plank. The hoops were made in sections and screwed together, a hack saw being found very useful for cutting out the sections. The body framework was then covered with sheet zinc, the only metal obtainable at the time. For the springing Egerton managed to secure a couple of Clyno C springs, which he attached to the rear, and hinged the front to give the necessary movement. The sidecar was then attached to a Triumph, and the outfit, we are informed, has been running daily for three months without giving trouble.

### MR. SCOTT'S BROTHER KILLED.

IT is with very sincere regret we learn that Lt.-Col. C. E. Scott, late commander of the 1st/6th West Yorkshire Territorials, and formerly director of the Scott Engineering Co., Ltd., succumbed a few days ago to wounds in the arms and thigh. Three weeks ago we mentioned in these columns that Col. Scott had been wounded, but the serious nature of his injuries was not at the time realised. Col. Scott died at Camier Hospital, his wife being present, and we tender our sincerest sympathies to her and Mr. Alfred Scott, the well-known inventor, in their loss.

SIDECAR BUILT BY A SOLDIER IN FRANCE

(See paragraph on this page.)

Names: Standing, Cpls. Davis and Kelly, and Sgt. Moon; Cpl. Chamberlain on carrier, Cpl. Powell in sidecar, and Art.-Cpl. Egerton builder of the body, in the saddle.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

### An Appeal.

Sir,—Being a prisoner of war, a keen motor cyclist, and a constant reader of your valuable paper, I shall be pleased if you will let me appeal to your home readers for any small gift of cigarettes or eatables. Any small parcel would be very gratefully accepted by a gravel-crushing Territorial.

PHILIP T. ELLIS (CPL.)

Gefangenenlager, Dülmen i. Westf., Germany.

### Three or Four Wheels.

Sir,—Mr. Scott in his reply to Mr. Burnard writes, "hitherto the man wanting comfort and cleanliness has had no other alternative" than the four-wheeler. He ignores apparently the A.C. and the Morgan, which have, I venture to think, already accomplished what he hopes to achieve. But I welcome the coming of the Scott with interest, not at all with apprehension, and hope to meet it in friendly rivalry in competitions after the war. It is a further proof that the three-wheeler, which the Morgan has done something to popularise, is coming into its own. A correspondent in your contemporary *The Light Car* remarked that the A.C. and the Morgan had not received the flattery of imitation by other makers. As regards the Morgan, I may point out that several important points, to which the success of the Morgan is largely due, cannot be imitated. They are covered by patents.

H. G. MORGAN.

### A Home Made Turnout.

Sir,—I think the accompanying illustrations would interest many readers.

The sidecar, excepting a portion of the sidecar chassis, I made three years ago, and it has proved very successful, is very comfortable, strong, and weatherproof, is made with sheet metal, and has carried two persons on many occasions. The motor was redesigned and built since November last. The engine is a 1910  $3\frac{1}{2}$  h.p. two-stroke P.M.C. I bought this engine in 1910, but have not used it until this year. I have made a few alterations to it. Gear, four-speed Jardine. Carburetter, Binks, latest three-jet. Saxon forks. Stewart speedometer. Special guards. Large footboards, cork studded. Bowden control. Spring seat.

It is clean and comfortable to drive. The top gear is  $3\frac{1}{2}$  to 1, and it will climb any hill I have yet met with full

load. I cannot say what speed it will do, but have done just over 30 m.p.h. without forcing it all out. I have been getting 45 to 50 m.p.g., but hope to improve upon this.

W. H. MUSKETT.

### The Silver Paraffin Vaporiser.

Sir,—May we reply to Mr. A. Durant's letter in your issue of August 17th? This gentleman makes an emphatic statement contradicting Mr. T. Silver's claim.

If Mr. Durant will refer to some of the articles already published on this vaporiser he will note it is distinctly stated that this vaporiser was used in 1903, and made prior to that date. It is probable Mr. Durant was not connected with the motor trade at that time.

Therefore, until we hear of another claim previous to 1903, we must still adhere to our statement, i.e., that Mr. Silver was the originator of the vaporiser.

We would like to remind Mr. Durant that the vaporiser is protected.

QUADRANT MOTOR CO.

### Petrol 5/6 a Gallon?

Sir,—Like other motor cyclists, I am allowed two gallons of petrol per month. How am I to be certain that the tin with which I am supplied contains that amount? I have just weighed one tin of petrol (seal unbroken) against another and find a difference of between 7 lb. and  $7\frac{1}{2}$  lb. The fullest cannot be more than full, and, presumably, the tins are not made to contain more than two gallons. What amount of petrol does the lightest tin contain?

Can you tell me what a tin containing two gallons ought to weigh? I am a clergyman, with a large and scattered country parish, and my work involves a mileage of not less than 300 miles per month. I cannot under the present arrangement pay the same number of visits to the sick and poor, though rich neighbours may use six times the amount of petrol for pleasure rides. But at least let me be sure that I do get my two gallons.

A.J.W.

[A gallon of petrol weighs about  $7\frac{1}{2}$  lb., therefore one of the tins cannot be much more than half full. A full tin should weigh about 18 lb. This is by no means the first complaint of this kind that we have received. We should advise our readers to weigh the tins before accepting them where this is possible.—Ed.]

Sidecar outfit built by our correspondent, W. H. Musket

### A Combined Vaporiser and Whistle.

Sir,—I send you a sketch of an invention with which I have been running my motor cycle for some time past with very great success and also with the utmost economy. The drawing, which I have sent to the Patent Office for protection, is self-explanatory. I consider it to be an ideal and simple combination, suitable for any machine, and one which will prove to be a great boon to motorists during the coming winter.

A combined whistle, decompressor, and vaporiser. (See letter from E. Rowland.)

Taking it in the first place as a vaporiser, it is most effective. By simply opening the decompressor an easy start is assured, and a good blast of hot air is forced round the carburettor, thus warming up in a few seconds; then while running, the decompressor is closed, the air in the pipe being kept warm without any escape of gas, and the increased area of the chamber (owing to the pipe being part of it) prevents knocking and reduces any tendency to over-heating.

I believe this to be the only vaporiser that can be regulated whilst running, whilst as a syren or whistle it is a terror, and this again can be regulated from a mild to a hair-raising alarm, and it can be fitted to almost any machine with ease.

E. ROWLAND.

### Sidecars and Cycle Cars.

Sir,—I am much interested in the controversy of the passenger motor cycle problem, now raging in your most excellent journal.

I should be glad if a few remarks by myself would be acceptable. In the first place, why is Mr. Scott, that well-known talented designer, giving us a resurrection of the sidecar? Mr. Scott is, I should say, a far-seeing business man, who knows that the cycle car will come into its own by sheer merit, and the sidecar will be a relic of the past. Now, no one can possibly admit that the sidecar is mechanically correct, although as a passenger-carrying machine it answers well. But, beyond this, there is a public desire, and rightly so, that a machine may be evolved having the virtues of the sidecar combination without its defects.

The question then arises, what form must this vehicle

take? Now the point is there are three factors to be considered—efficiency, cheapness, and appearance. It must be admitted that cheapness is generally associated with inefficiency and nastiness; but cheapness should be associated with simpleness. Now we have the clue: cut away all your unnecessary complications, design your machine to be efficient, give a kind regard to the appearance, and you have the ideal cycle car.

Personally, I claim to have designed, built, and tested for a mileage of 12,000 a machine built on real cycle car lines, not a machine composed of scrap parts of small cars. The sense of security, the accessibility of working parts, and the simpleness of construction are a revelation. Is there a sidecar combination to-day whose owner does not covet the genuine cycle car, and long for the day when he may easily possess such a machine? That such a demand does exist is evident by the number of letters and enquiries I have received.

At the moment I await the opportunity of a large manufacturer who can prepare and place on the market in large numbers this ideal machine, which can easily be retailed at £75.

GEO. HADDEN.

### The Boycott of German Goods.

Sir,—It is with extreme regret that I find that *The Motor Cycle* is supporting the idea of a trade war with Germany after the present blood war shall have ceased—a support which puts "Britisher" in such high feather. Is it not enough that muddling diplomacy on both sides should have brought all Europe into the catastrophe of blood and murder? Are we, the inhabitants, and, *ipso facto*, the sufferers, going to show that even democracy is just as muddleheaded as its diplomatists, in that we are calling for a continuation of the hatred on "business lines"?

Have we forgotten that we entered the war for the purpose of defending the neutrality of Belgium, and that no ulterior motive, apart from any diplomatic arrangements to help France "in certain eventualities," moved us to take the unfortunate step?

"Britisher" says we "must shut out German competition," and if we do, what then? Are not all advances in arts, sciences, or engineering brought about by a comparison? How then shall we compare our motors with German motors, and show the superiority of ours if we are to shut them out?

I take it that we all want the war to end; but are you helping the end to come by announcing the fact that you are determined to crush Germany now and after the war? You at once, by such action, give Germany the justification for saying that the war, as far as she is concerned, is a war of defence!

"Britisher" says that the "spirit of German Kultur" must be crushed, and I agree with him; but does "Britisher" imagine that he is going to accomplish that object by so stifling Germany that she is unable to rise from the baseness of that kultur by reason of the fact that she is not allowed to rise even commercially?

Suppose you do crush German trade in this country and elsewhere, will it be to the credit of Great Britain that we have crushed it by force of arms and political trickery rather than by sheer merit? Let "Britisher" reconsider, and see if he cannot propound some better means of helping Germany to rid herself of the shibboleth of "Kultur."

H. PRITCHARD.

G. Hadden's four-wheeled two-seater. The specification includes a 654 c.c. twin air-cooled J.A.P. engine, transmission by chain and belt, and a two-speed gear *a la* Ford. The weight, we are told, is only 3½ cwt., and the average consumption 75 m.p.g. (See letter on this page.)

## You don't mind

doing without the Sturme-y-Archer Gear now because you know it is on national service.

### Extract from "THE MOTOR CYCLE TRADER," Aug. 4/16.

**WHAT A NORTON WILL STAND.**—A Norton "Big Four" machine, with De Luxe pattern sidecar attached, was recently employed for conveying **two heavy passengers**, in addition to the **driver**, four full cans of petrol and some luggage, a distance of nearly twenty miles, including the traversing of some of the worst streets in Birmingham from the traffic point of view. The sidecar passenger weighed  $11\frac{1}{2}$  stone, and the occupant of the carrier seat 14 stone, the driver turning the scale at  $10\frac{1}{2}$  stone, or **37 stone in all**. The petrol cans with their full complement of spirit would add something considerable to the weight, and the combination empty must weigh very nearly, if not more than, 400 lb. There was also a full tool kit and some heavy overalls, etc., in the "boot." The total weight resting on the three wheels would certainly run very close to **1,000 lb.**, and with this the **single-cylinder engine of 650 c.c.** simply played with the Bull Ring Hill in middle gear, and afterwards negotiated some quite long and trying grades without having to come down from top. The power of this engine is unquestionably very high.

## THE PREMIER BRITISH-BUILT MOTOR CYCLE,

74, Great Portland Street, LONDON, W.

## The Paragon Folding Sidecar Chassis.

WE hear a great deal of economy these days, and motor cyclists as a body have to practise it in a rigid form, as regards petrol. At the same time, there is another kind of economy that has to be considered by some riders, and that is the economy of space. This often assumes an acute form in the case of keen sidecarists whose accommodation for their outfits is very limited. Sidecarists who are awkwardly situated as regards space will be interested in the Paragon folding sidecar chassis, the chief feature of which is the fact that it is capable of being folded. It is a sound idea that has now stood approximately two years' testing in the hands of various users.

The chassis drawing shows it on the point of being folded. The body has been removed as well as the tension arm, which is fastened to the lug by means of a quickly detachable bolt. The body is removed by pulling it backwards, and then pulling it again in the reverse

On the left are shown details of the fitting of body frame, A being the flat portion that is released when the body is taken off.

PARAGON FOLDING SIDECAR CHASSIS.

Examples of tradesman's and touring sidecar bodies on the same Paragon folding chassis.

direction. This releases the flat portion marked A, which engages with slots on the axle tube. When this is done the sidecar wheel can be pushed forward and allowed to lie closely up against the machine, and this will enable it to pass through a 30in. doorway.

The fact that the body is so easily detachable is a most important point, as a tradesman may use his machine for delivering goods and for pleasure purposes during the week-end. The sidecar is substantially constructed, the cross members, both in front and behind, being duplex and pivoted at each corner. Spring washers are provided top and bottom to prevent rattle, and castellated nuts are supplied secured by split pins. The front ends or tongues of the frame on which the springs are mounted are held in position by special trigger bolts.

## Sidecar Dust and its Preventive.

ONE of the greatest drawbacks to sidecaring is the dust that is sucked up by the back draught of the body, and which generally deposits itself in the hair of the lady passenger.

The idea, as seen from the sketches, consists of an air scoop and tube led through the offhand side of the sidecar, and so through to the back. A saw-cut through the tube, a stopper in the end of it, and slot cut in the back of the sidecar complete the fitment, and a neat and non-obtrusive job can

be made of it with a little care. My idea is that the wind pressure sucked up by the scoop will, when forced through the narrow slit at the rear of the sidecar, effectually break up the air eddies that cause the dust.

I should be interested to hear from any sidecarist who tries the experiment and to compare results. It is, of course, necessary to have a scoop of greater capacity than the slit at the rear—about 4 to 1, I think, would be the happy medium. H.M.

[The idea is, we think, based upon a fallacy, and we shall be surprised to hear that it is successful.—Ed.]

An attempt to lay the dust. In the plan view the letters refer to the following:

- A. Saw-cut letting out the compressed air.
- B. Scoop.
- C. Thin tubing.
- D. Small tin can cover soldered to end piece of pipe.

A simple gadget which I am fitting to a sidecar might, I think, prove interesting to family men, or those who have sidecars and are lucky enough to have fair passengers for them.

### A Motor Cycle Fire Engine.

The illustrations depict a motor cycle, the rear wheel of which is adapted for use as a water pump. The motor cycle

could thus be used for quenching fires, emptying flooded cellars, etc. In construction the enclosed rear wheel is divided into two chambers by a partition A, the right-hand chamber enclosing a rotary pump B. The water enters at C, and from the pump chamber it passes

through valves in the partition A to the left-hand chamber, and thence to the delivery pipe. Chain gearing D is provided on the motor cycle, whereby the back wheel may either be driven in the ordinary way, or, when the back of the machine is supported on the stand E,

the gearing may drive the rotor B of the pump. The necessary hose piping is shown at F. Whilst possibly the machine might not be particularly comfortable to ride, it would probably be very useful for the contingencies for which it is apparently designed.—W. H. Bridges, No. 10,284, 1915.

### Another Sidecar Gun Mounting.

The sidecar frame has an approximately rectangular base A, and supports at the front and rear sockets B C for the

machine gun D. The gun may thus be mounted in either socket so as to face either forwards or backwards with regard to the machine. A spring-supported seat

E is provided for the gunner, with back rests at F. A support G is provided on the sidecar to give stability when the outfit is stationary.—The Enfield Cycle Co., Ltd., and P. W. Smith, No. 914, 1915.

### Two-stroke Exhaust System.

In order to improve the exhausting of burned gas from the cylinder a rotary air pump A, driven from the crankshaft B, is arranged in the exhaust box C. The result is to set up a partial vacuum

in the exhaust system, which has an eductor effect on the burned gases directly the port is uncovered by the movement of the piston.—Villiers Engineering Co., Ltd., and F. H. Farrer, No. 13,986, 1915.

### An Internal Hub Brake.

The fixed spindle A has mounted on it a sleeve B, upon which is carried the

hub shell C. At the left-hand end the hub shell is enlarged to enclose a stationary brake ring D, and this ring D is expanded by cam mechanism, as usual, operated by rotating the sleeve B. To effect this the sleeve has fixed upon it a grooved wheel F, around which wraps the cable of a Bowden wire mechanism (not shown). By pulling on the wire the sleeve B is rotated, expanding the fixed ring D into contact with a surface on the rotating hub shell C.—W. S. Harris, No. 8,853, 1915.

### The County Chemical Co.

The manufacturers of the Chemico specialities are now in a position to give much better deliveries than at any period over the last eighteen months, and the position is daily improving.

### Catalogues Received.

We are in receipt of the latest catalogue of Ixion two-stroke motor cycles. The latest model Ixion is a 2½ h.p. three-speed sidecar, the three-speed gear being in the hub. (The Ixion Motor Manufacturing Co., 35, Great Tindal Street, Ladywood, Birmingham.)

### Scott Spare Parts.

The Enfield Cycle Co., Ltd., of Redditch, inform us that they have a number of spare parts for frames, forks, etc., for Scott machines. They will be pleased to send particulars to any motor cyclists or agents who are wanting such parts.

### Repairs to Three-speed Gears.

We recently paid a visit to the workshop of the County Cycle and Engineering Co., at 64, Staines Road, Hounslow, who make a speciality of repairs to three-speed gears, a special work which is often in demand by our readers. We noted that the work was carried out extremely well, and that the parts made were excellently finished, and looked as if they would give first-class service.

### The John Bull Lace-up Tyre Gaiter.

A bad burst often, in the end, means a new cover; a large cut in the tread can be temporarily filled with tyre stopping, but this does not last long, and ultimately the cover must be remodelled by the makers or discarded. One of the most effective methods of extending the life of a tyre is to use a gaiter. The

The John Bull lace-up gaiter.

Leicester Rubber Co., Ltd., has introduced a new type which meets the requirements of the higher powered passenger motor cycle fitted with the larger section of tyres. It can be adjusted, by means of the strong lace supplied with each gaiter, to fit perfectly any section tyre from 65 mm. up to 80 mm. The rubber employed in its manufacture is of exceptionally good quality, and it will form a very useful addition to the equipment of the motor cycle.

# WAR - TIME TESTIMONY

Second-hand  
Bargains

The rates for paragraph advertisements in *The Motor Cycle* are: First 12 words or less 1/6, and 3d for every additional two words. Each paragraph is charged separately and name and address must be counted. Advertisements should be posted to arrive not later than by first post on FRIDAY morning for the following Thursday's issue. Address *The Motor Cycle*, Coventry, or 20, Tudor Street, London, E.C.

During the war *The Motor Cycle* has enhanced its already high reputation as THE newspaper for motor cyclists. It is read by practically every owner (and intending buyer), whether in the army, navy, air service, or civil life, and is, therefore, the most suitable medium for readers' advertisements of second-hand goods — for sale, wanted, or to be exchanged.

## Callers on day of publication.

In respect to my advert. in *The Motor Cycle*, on arriving home on Thursday afternoon I found a gentleman had been waiting two hours to see my machine. Since then I have had 10 APPLICATIONS, and my wife informs me that as early as eleven o'clock on Thursday morning a man came to see the machine.

C. HECTOR PETERS,

13, Mayow Rd., Forest Hill, S.E.

## An excellent advertising medium.

I must give *The Motor Cycle* credit for being an excellent advertising medium. Your paper must have been newly published when QUITE A HOST OF OFFERS came for my carburetter, and also offers to supply tank I asked for.

JAMES PAUL,

124, High St., Perth.

## Sold same day.

I wish to thank you for inserting the last advert. I sent in place of the one that was too late.

It may interest you to know that the machine was SOLD THE SAME DAY that the advert. appeared. I also had MANY WIRES AND LETTERS.

Undoubtedly *The Motor Cycle* is THE paper for motor cyclists in every way.

J. L. RUTTER,

Newlands Park, Sydenham.

## Delighted with speedy replies.

I am delighted with speedy replies received through the medium of your valuable paper, *The Motor Cycle*. Last week, advertising exchange, I have HAD REPLIES EVERY POST, and have suitably exchanged with a satisfied reader.

G. HARROP,

57, Abbeyhill Rd., Oldham.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be couched. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed**

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal to perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the productions of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

## Norton.

**NORTON**, 1915-16, 3½ h.p., T.T. lamps, etc.; £45; no offers; military reasons.—7, St. Mark's Rd., Notting Hill, W. [19827]

## N.S.U.

**6½** h.p. Twin N.S.U. Engine, overhead valves, Rothardt mag., brand new; £21.—Pilot, John Bright St., Birmingham. [X6295]

**FOR** Sale, bargain, N.S.U. motor cycle, 4½ h.p., unfinished; £21.—F. Barnett, Belleville, Lower Whitely, Reading. [19782]

**N.U.T.** 3½ h.p. Twin, 1914, 3-speed, bargain; £36.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [19606]

## O.K.

**1915** O.K., 2½ h.p., 4-stroke, overhead valve, Bates and Dunlop tyres, perfect condition, engine just overhauled; £22/10.—Robinson's Garage, Green St., Cambridge. [19853]

## Omega.

**OMEGA** 2-stroke, July, 1915, 3 h.p., as new, all accessories; £20.—Murphy, 57, Rochdale Rd., Blackley, Manchester. [X6010]

## P. and M.

**3½** h.p. P. and M., 2 speeds, and free engine, entire chain drive; £21/10.—Colmore Depot, 31, Colmore Row, Birmingham. [X6078]

**1914** 3½ h.p. P. and M., 2-speed, wicker sidecar, in perfect condition; cash or easy terms; £45.—R. E. Jones (Garages), Ltd., Swansea. [10721]

**P. and M.**, 1912, 2-speed, wicker sidecar, good condition, recently overhauled, fully equipped; £35.—170, Granville Rd., Child's Hill, N.W. [19832]

**1915** 4-speed 6 h.p. P. and M., with 25 gns. Gloria sidecar, 5 gns. Cowey, Lucas horn, unscratched, perfect, all tools, tyres like new, only done 1,800 miles; cost £120, accept £95.—66, Morpeth St., Hull. [X6268]

**3½** h.p. P. and M. 1913 Coachbuilt Combination, under slung screen, handle starting, 2-speed, free engine, lamps, back-rest, 95 m.p.g., smart lot; any trial after 7; £35.—44, George Lane, Lewisham, S.E. [19872]

**P. and M.** 1914½ Combination, with Phelon and Moore coachbuilt sidecar, full equipment, in perfect condition; only reason for selling, owner in the army; must be sold; best offer secures.—Campbell, Outgate, Cleator, Cumberland. [X6121]

## Peugeot.

**PEUGEOT**, 6-7 h.p. N.S.U. 2-speed, free, new belt and tyres, sidecar, Millfold side entrance, perfect; £20.—Laurel, Smith Works, Twickenham. [19852]

## Precision.

**1915** 3½ h.p. Precision, Calthorpe 2-speed countershaft, enamel and plate as new; exchange for twin, or sell £30.—42, Mellows Rd., Beddington, Surrey. [19767]

## Premier.

**PREMIER**, 2½ h.p., runs on substitute; £18, or offer.—9, Holly St., Smethwick. [X6251]

**3½** h.p. Premier Combination, 2-speed countershaft, like new; £45.—193, High St., Tonbridge. [X6206]

**1914** 2½ h.p. Premier, perfect order, new condition; £17.—Montgomery, Victoria Rooms, Bristol. [X6105]

**PREMIER**, 3½ h.p., T.T. engine, new tyres and belt, Binks carburettor; £25.—101, Tooting Bec Rd., S.W. [19949]

## MOTOR CYCLES FOR SALE.

## Premier.

1914 3½ h.p. Premier, 2 speeds, coachbuilt sidecar; £45; cash or easy terms.—R. E. Jones (Ourages), Ltd., Swansea. [0823]

1913 Premier, 3½ h.p., 3-speed, and sidecar, re-enamelled and overhauled; £32.—Hyde, 69, Newlands Rd., Stirlchley, Birmingham. [X6231]

1914 2½ h.p. Premier, clutch model; Armstrong 3-speed, perfect condition, h.b.c.; £25.—Rigby, Liverpool Rd., Loughton, Lancs. [X6243]

PREMIER, 1913, 2½ h.p., complete; this machine is in exceptional condition, quite economical, and thoroughly desirable; £20.—Laytons' Garage, Bicester, Oxon. [X6240]

PREMIER, 3½ h.p., and Millford sidecar, new 1915, 3-speed countershaft, F.R.S., speedometer, every spare, faultless condition; nearest £50, real bargain.—10, Genoa Rd., Anerley. [X6247]

PREMIER, 3½ h.p., 3-speed, late 1913, little used, in first-class condition, new back tyre, will stand any investigation, £35; also 1915 coachbuilt sidecar, with hood and screen, £9; will sell together or separately.—L., Atlas Co., Stanley Rd., Woodford. Tel.: 189. [X6259]

## Radco.

RADCO, 2½ h.p., little used, must be sold; price £17/17, bargain.—T.H.L., 288, Romford Rd., E. [X6258]

1915 Radco, 2-speed countershaft gear box, T.T. bars; £24/10.—Colmore Depot, 31, Colmore Row, Birmingham. [X6097]

GENUINE 1915 Radco, single speed, 2-stroke, lamps, etc.; 18 gns.; pay good cash difference for recent combination.—Newham, 223, Hammersmith Rd., W. [X6255]

RADCO, 1914, 2-stroke, 2-speed countershaft gear, practically new tyre, in real good order; must sell; £18, no offers, bargain; bring reasonable distance.—Butlin, Bungalow, Galleyswood, Chelmsford. [X6185]

## Regal.

1914 Regal, 2-speed, 2-stroke, open frame, guaranteed as new; £24/10.—Colmore Depot, 31, Colmore Row, Birmingham. [X6096]

REGAL-GREEN-PRECISION, 5½ h.p., 3 speeds, coachbuilt sidecar, very little used, perfect condition; £42.—38, Nicholls St., West Bromwich. [X6207]

1915 Regal-Green, 3-speed Sturmey countershaft gear, and clutch, special sporting sidecar; £47/10, complete with accessories.—Colmore Depot, 31, Colmore Row, Birmingham. [X6083]

## Rex.

REX, 3½ h.p., free engine, kick starter, £7/10; wanted, combination, about 4½ h.p., below £40, instalment, preferred.—89, Marlborough Rd., Bowes Park, N. [X6208]

3½ h.p. Rex, accumulator, h.b.c., new Dunlop belt, 2 engine fine condition, less tyres and saddle; what offers?—William Cook, Stafford Cottage, Philadelphia Rd., Portcawl. [X6130]

REX de Luxe Twin, 6½ h.p., 1913-14, art cane sidecar, lamp, horn, speedometer, and carrier, all new tyres; 48 gns.; seen by appointment.—181, Bowes Rd., New Scutgate, N. [X6253]

REX, 6½ h.p., 2 speeds, clutch, Service belt, speedometer, lamps, grand tyres, cane sidecar, whole turnout in thorough order and condition; great bargain, £28.—38, Loughborough Rd., Brixton, London. [X6889]

1914 Rex 6½ h.p. Twin, 3-speed combination, with 2-seater sidecar, complete with accessories, in first-rate order; £45.—Tuke and Bell, Ltd., Motor Dept., Carlton Engineering Works, High Rd., Tottenham, N. [X6749]

REX 6-8 h.p. Twin, coachbuilt combination, 2-speed, belt drive, free engine, kick starter, shop-soiled only; accept £65; take any machine part payment; good price allowed.—A. Holland, Clarendon St., Coventry. [X6287]

## Rex-Jap.

6 h.p. Rex-Jap, fitted with coachbuilt sidecar, Grado Multi pulley and free engine; £27/10; guaranteed.—Wauchope's, 9, Shoe Lane, London. [X6195]

## Rover.

1915 Rover Combination, cannot tell from 1916 machine; £65.—Colmore Depot, 31, Colmore Row, Birmingham. [X6095]

1913 Rover, 3-speed gear, clutch, and pedal start, splendid order; £35.—Colmore Depot, 31, Colmore Row, Birmingham. [X6099]

ROVER, 1915½, countershaft 3-speed, in excellent condition, lamp, horn, and spares; £48.—Helling, Beechen Cliff House, Bath. [X6127]

ROVER, 1916, 3-speed, kick start models, immediate delivery from stock.—Colmore Depot, Rover Agents, 261, Deansgate, Manchester. [X6545]

ROVER, 1916, 3½ h.p., 3-speed countershaft, £66/10; combination, £85; in stock, immediate delivery.—Wallace, Fountain Buildings, Bath. [X6021]

1914 3½ h.p. Rover, and brand new Canoelet Minor sidecar, all in splendid order; £45.—Colmore Depot, 31, Colmore Row, Birmingham. [X6081]

ROVER, 3½ h.p., 1912, clutch model, sound order, finish £20; a good sturdy machine at the clearance price of £20; no offers, please.—Laytons' Garage, Bicester, Oxon. [X6235]

## Spare Petrol Tanks

Specially designed for Paraffin Conversions, with large filler cap, union cock, T piece, and two feet of copper tubing, the whole forming a complete outfit.

8/- complete.

These KEMPSHALL new heavy ANTI-SKID COVERS are also an opportunity you should not miss:—

26 x 2½	22/6	28 x 2½	28/-
26 x 2¾	25/-	28 x 3	29/6

## Torpedo-shaped Acetylene SIDECAR LAMPS,

well-finished in black or nickel-plated, showing red light to rear, complete with bracket, 10/- each.

Accessories of all kinds, and Motor Cycles, in good condition, wanted for cash or exchange. Any goods supplied on confidential easy payments if desired.

## A FEW SPECIAL LINES IN OUTFITTING.

SERVICE WAJERS, Leather Soles (all Sizes)	25/-
(Order now, as the price will advance shortly.)	
SERVICE WATERPROOF SUITS, best quality	25/-
SERVICE BLACK OILSKIN SUITS	10/11
SOU'WESTER to Match	1/11
BLACK HORSEHIDE GLOVES, Lined, Gauntlets	3/3
AIR PILLOWS	1/6

## SERVICE GOGGLES.

BEST QUALITY LENSES, 3/6.

SERVICE EYESHIELDS (Non-inflammable), 2/6. Goods sent on approval against Deposit.

## The Service Co. (London) Ltd.

292-293, High Holborn, London, W.C.

Telephone—6430, Holborn.

## MOTOR CYCLES FOR SALE.

## Rover.

1912 Rover, 3½ h.p., free engine, B. and B. carburettor, Bosch mag., excellent condition, with good tyres and engine; £20.—Robinson's Garage, Green St., Cambridge. [X6855]

ROVER, 1914, 3 speeds, enamel, etc., perfect, unused 18 months, new coachbuilt sidecar used once; £45, or exchange for 1916 Douglas, or with cash for really good twin combination.—S., 41, Ash Rd., Stratford. [X6951]

GENUINE 1914 Rover Coachbuilt Combination, 3½ h.p., 3-speed model, exceptionally fine condition, complete with special aluminium numbers, speedometer, lamps, horn, etc., very handsome outfit; 53 gns., or close offer.—Newham, 223, Hammersmith Rd., W. [X6956]

## Royal Ruby.

ROYAL Ruby, 1915, 2½ h.p., 2-stroke, spare belt, accessories, excellent condition; £19.—Seed, 14, Laburnum Av., Vauxhall. [X6756]

1915 Royal Ruby, 2 speeds, 2-stroke, open frame, spit either lady or gent; £27.—Colmore Depot, 31, Colmore Row, Birmingham. [X6095]

## Rudge.

1912 3½ h.p. Rudge, free engine, good condition; £25.—R. E. Jones (Garages), Ltd., Swansea. [0785]

1913 Rudge Multi, 3½ h.p., coach sidecar, good condition throughout; £37.—Collins, Harlow. [X6951]

FOR Sale, Rudge Multi; owner joined the forces.—Apply, Simpson, The Old Hall, Ackworth, Pontefract. [X6746]

RUDGE, 3½ h.p., 2-speed, and sidecar, disc wheels; £35.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [X6066]

1913 Rudge, 3½ h.p., clutch model, in fine condition; £29; easy payments arranged.—Jones, Garage, Broadway, Muswell Hill. [X6949]

RUDGE, 1912, 3½ h.p., T.T., 3 new tyres, belt, good condition throughout, very fast; £26.—6, West Heath Av., Golder's Green. [X6771]

1914 Rudge Multi, 5-6 h.p., with Rudge sidecar, complete with all accessories and spares; £45.—11, St. Anthony's Av., Eastbourne. [X6874]

RUDGE T.T., late 1912, specially tuned, racing cams, very fast, excellent condition and appearance; will sacrifice for 19 gns.—1, King St., Acton. [X6928]

1914 3½ h.p. Rudge Multi, Empire coachbuilt sidecar, in perfect condition, 3 lamps, speedometer, and horn; £40.—201, East Barnet Rd., New Barnet. [X6938]

RUDGE Multi, 3½ h.p., late 1915, military finish, with Montgomery sporting sidecar, tip-top condition; £40, no offers.—F.A., 614, Wandsworth Rd., S.W. [X6194]

5-6 h.p. Multi Rudge, in good condition, and accessories; £32, or will exchange for good lightweight; seen any time.—Bonnds, Garage, High Rd., Kilburn. [X6801]

1915 Rudge Multi, 5-6 h.p., and coachbuilt sidecar, fully equipped, speedometer, spares, etc., little used, fast, powerful; first cheque £45 secures; called up, must sell.—A. Hurley, 2, Eden St., Kingston, S.W. [X6875]

## Scott.

COLMORE Depots, Birmingham and Manchester, for Scott motor cycles. [0806]

SCOTT 1913 Combination, in real nice condition; £32.—6, Warren St., London. [X6977]

SCOTT, 1913, excellent condition, newly overhauled and enamelled; £35.—Henderson, 4, Mary's Place, Edinburgh. [X6942]

1914 Scott Combination, absolutely perfect, Binks carburettor, speedometer, lamp, horn, spares; 45 gns.—Tunstall, Draper, Huddley. [X6181]

1914 Scott Combination, in splendid order, guaranteed in perfect order, all accessories; £50; easy payments arranged.—Jones, Garage, Broadway, Muswell Hill. [X6963]

1913 Scott, perfect condition, 15 gns. Canoelet sidecar, wind screen, B. and B. electric horn, lamps, new tyres; £38/10.—Garaged at 163, Loughborough Rd., Brixton. [X6966]

SCOTT, 1913, Millford cane sidecar, 1914 lubrication, thoroughly overhauled by makers, new crankcase, front wheel, mudguard, and forks 1916; £42, offers.—Findlay, 98, Bryn Rd., Swansea. [X6257]

## Simplex.

1914 2½ h.p. Simplex, 2-stroke, splendid order; £19.—Colmore Depot, 31, Colmore Row, Birmingham. [X6090]

## Singer.

SINGER, 3½ h.p., free engine, 1912, in nice condition; £18.—6, Warren St., London. [X6978]

1914 4½ h.p. Singer Combination, 2-speed gear, pedal start and clutch; £37.—Colmore Depot, 31, Colmore Row, Birmingham. [X6080]

3½ h.p. Singer, 1913, clutch model, good condition, £10 new parts, runs well on pure paraffin; any trial; £24/10.—Glenville, Desboro Park Rd., High Wycombe. [X6192]

## Sparkbrook.

SPARKBROOK, 1916, 2-stroke, 2-speed, month old; £34.—Digby, Mersea, Essex. [X6735]

## Overheating and Engine Stops.

THE writer of an article which we publish in this issue puts forward a very interesting theory with reference to the results produced by overheating, or what is commonly supposed to be overheating. The case to which he alludes is when an engine simply "peters out," after a long spell of hard work, without konking (owing to pre-ignition) or any of the usual symptoms of under-oiling and partial seizure. He found, when making some observations of an electric spark passing between two wires .5 mm. apart (about the distance plug points are usually set), that as the wire points, and consequently the air surrounding them, became heated, the sparks diminished in intensity until the electric current passed in the form of a "silent discharge," i.e., without causing any spark, the reason for this being that heated gas becomes a fairly good conductor. Presumably the air was more or less at rest, and was therefore heated by the wires. This condition would not obtain at the plug points, where the gas is being replaced at every stroke, but, on the other hand, the same amount of heat might easily be present in the gas, owing to the general temperature of the whole cylinder head after the hard work done by the engine in hill-climbing or a speed burst.

The ignition of petrol vapour requires a minimum temperature of rather more than 700° F. (In the case of paraffin and benzole the temperatures are 600° F. and 900° F. respectively. These figures explain why konking is common with paraffin, but extremely rare with benzole.) If compressed gas becomes a sufficiently good conductor to admit of a "silent discharge" at a less temperature than this, the theory is obviously a possible one. And, be it noted, it is not yet put forward as being proved, but only tentatively. It is, however, a matter of much importance and interest, and if any of our more scientific readers can throw any more

light on the subject, they will be conferring a benefit upon motor cyclists, and, in fact, the whole motoring community.

## Motor Fuels after the War.

IN view of the fact that the question of motor fuels is a most important one at present and likely to remain in the front for some considerable time after the coming of peace, the article in *The Autocar* of August 19th on "The Yield of Benzole" will have been read by many with very great interest. In the opinion of some, petrol will be dumped on the market at a very cheap rate: so cheap that motorists will not consider the purchase of benzole at ordinary prices. If petrol be cheap, so much the better; but we know many riders who always used benzole in preference to petrol in the pre-war days when petrol was really petrol.

The author of the article to which we refer, however, makes the welcome assertion that, "judging by the fact that the coal tar industry is vastly more profitable than most others, it does not seem outside the regions of possibility that good profits can be made, even if benzole were almost given away." Without going deeply into technicalities, we may say that benzole is only one of several valuable by-products obtained from coal in the making of gas, some others being coke, tar, and ammonia. Coke is used for metallurgical industries and for household purposes. Tar produces many valuable compounds which yield important dyes, toluene used in the manufacture of explosives, solvent naphtha, a certain amount of benzole, pitch, and other substances too numerous to mention. There is a large demand for ammonia as a fertiliser.

Thus we see that, quite apart from the value of the benzole, the coking of coal and subsequent distillation of the by-products may be very profitable. It has been estimated that, if 50% of our yearly consumption of coal were treated in this way, the yield of benzole would be about two hundred million gallons.

### Difficult Starting.

In view of the many complaints about reluctance to start which we receive, I give prominence to the ancient tip of covering the air intake of the carburetter. I met a new machine at the station last week, and, after filling the tanks, made about thirty vain attempts to get the engine going with the kick-starter. Finally I held a rag over the air intake, and it started at the next kick. The engine has behaved similarly ever since, and though it will not start at all by any other dodge, it invariably answers to the first kick if the air intake is covered up.

### Spring Frames and Freak Hills.

I have now had time to test Mr. Bethwaite's contention that spring frames are inferior to rigid patterns on freak hills. My conclusions are that the answer must depend on the type of spring frame, crediting Mr. Bethwaite with complete sincerity. In my tests a spring frame A.B.C. and ditto  $2\frac{3}{4}$  h.p. Douglas (1916) were pitted against a 1916 rigid frame machine up two hills of phenomenally bad surface; I can indicate the atrocious nature of the road by saying that the foot-rests on both sides of the A.B.C. were bent backwards by the sides of a rut in which I had to ride, in order to avoid boulders lying on the hoof track. Nobody outside Bedlam would pretend after three ascents of this hill on my trio of machines that the spring frames are not infinitely superior; and Mr. Bethwaite's experience must surely be based on some pattern of spring frame which gives an excessive rebound.

### Converting a Douglas to Heavy Fuel.

I was sufficiently pleased with my early experiments with Binks fuel to order a full conversion set for my  $2\frac{3}{4}$  h.p. Douglas. The set is, of course, standardised for this popular make, and will slip into place after half an hour's work with a soldering outfit. It consists of three-jet carburetter, hot air pipe, neat black pint tank and clip (to carry a supply of petrol for starting), length of petrol pipe, T piece, and spare cone nut and union for coupling up. A cheaper mode of using heavy fuels and mixtures would take the form of utilising the existing carburetter; but I am a great believer in multiple-jet carburetters for this purpose, as the finer spraying orifices certainly assist the vaporisation of a sluggish fuel. Previous experience of three-jets indicates that even petrol benefits by their superior atomising properties; *a fortiori*, they are still more useful for petrol-paraffin and other noxious compounds.

### The A.B.C. Bicycle.

I have been overwhelmed with letters about my article on the A.B.C., and have one small correction to make. The article was written some months ago,

and the actual weight of the jigger was considerably overstated, partly because I came to it fresh from a baby two-stroke, partly because Mr. Bradshaw's typist struck a "3" instead of a "2" in writing to me on the subject. The weight is not more than that of the ordinary vertical single-cylinder 500 c.c. In reply to various correspondents, the machine is not capable of remarkably slow speeds on the fourth ratio; though it will tick over absurdly slowly in neutral, more slowly (I fancy) than any other engine would in normal adjustment, its power is attained by high engine revolutions, and there is not sufficient power at very low revolutions to permit the machine to run dead slow on a very high gear; I always change down to third gear for traffic work. I am hardly in a position to state what the normal petrol consumption should be, as I keep two or three bicycles running, and use the A.B.C. for speed work on good roads, or for fast climbing on freak roads. Still, I can get 70 m.p.g. under these conditions, and opine that a higher economy should be possible in steady riding on ordinary undulating roads. A further point is that the maximum speed obtainable on fourth gear is only possible when conditions allow the machine to be "whacked up." You cannot work engine revolutions up to an abnormal figure on an abnormal gear except where conditions approximate to track work. The machine is fast because it can attain unusual speeds on second and third gears, rather than because its phenomenal fourth gear maximum can often be resorted to, and because the combination of high r.p.m., a variety of gear ratios, and a terrific carburetter allow of ferocious acceleration. The "jump" when the engine is put on second gear and full throttle at the corner footing a single figure gradient is truly remarkable.

### Rapid Cylinder Wear.

Some months ago a reader in India asked my help in diagnosing an engine knock, which had developed on a new British machine of the first class within 700 miles of purchase. The knock turns out to have been due to wear of the cylinder bore, and two facts worthy of notice are that such wear should occur after such a short mileage, and, secondly, that it was not accompanied by any loss of power. The owner suggests that the dust of the Indian roads may be responsible. On this point the testimony of other Colonial riders would be interesting. Many Colonial riders have told me that naked chains are useless in their districts, as the fine dust permeates the chains and wears them out rapidly; but I never heard a Colonial rider complain that dust ground his cylinder bore oval so quickly. Makers of Overseas models may care to consider whether it is worth while providing extra protection for the main air intake.

## 1,200 MILES ON CHEAP FUEL.

Experiences of a Petrol Substitute  
with a 6 h.p. Sidecar.

The Petrol Restrictions need not  
Stop Motor Cyclists.

**A** DESIRE to keep going an only hobby and means of recreation, coupled with an intimation that permission could not be granted me to join His Majesty's Forces, led my wife and myself carefully to consider the possibilities of running on cheap fuel. Our machine is a 1914 model A.J.S. of 750 c.c. capacity, and up to this time had given us about 5,000 miles of faithful service, its running being all that could be desired in every respect. The sidecar is a Montgomery of 1915 pattern chassis, a worthy successor to a two-year-old chassis of lighter pattern, which (fortunately when empty) tried conclusions with a hedge and ditch in the New Forest at 4 a.m. on a summer day in June, 1915, the result reducing the chassis to a heap of scrap iron, but the light cane body survived, and was easily repaired and reinstated. For the sake of easy comparison the petrol consumption up to this time is appended.

Carburetter.	Jet No.	m.p.g.
Amac ... ..	26 ... ..	56

This over a year and five months, mainly with sidecar.

The ever increasing price of petrol, the difficulty of obtaining even the modicum allowed by Government, finally decided us, and a Binks three-jet carburetter was fitted and a supply of the Binks fuel obtained.

### Fitting the Carburetter.

The carburetter connection as sent was about 4in. long, and this was at first fitted to the already long induction pipe of the A.J.S. machine. The jets fitted when sent were Nos. 0, 3, and 7, and some little time was spent in trying over the machine with petrol as a fuel, and the jets finally decided on were Nos. 00 (a size smaller), 3, and 8 (a size larger).

At this stage a week-end run of 190 miles solo was undertaken over main roads in the South of England, the outward journey coming out at:

Carburetter.	Jets Nos.	m.p.g.	Fuel.
Binks ... ..	00 ... ..	66 ... ..	Petrol 2 with
	3		paraffin 3/4th.
	8		

The return journey was ridden under less favourable conditions in heavy rain for about half the time, and with a view to petrol economy the time taken was a good deal longer. Results:

Carburetter.	Jets Nos.	m.p.g.
Binks ... ..	As above. ... ..	77

Thus is the effect of an easier pace clearly seen. The supply of Binks fuel had now arrived, and a business run with sidecar attached of about thirty-five miles, necessitating some six or seven stoppages, was the first essay on the new fuel. I should say that the Binks system had been fully adopted, and a smaller tank for petrol for starting purposes had been fitted. I do not wish to lay too much stress on this first ride, as the effect of the overlong induction pipe and the want of a hot air intake was apparent. Most of the defects of bad carburation presented themselves in that thirty-five mile run, and the consequent inability to climb hills which should have been easily taken on top gear proved very disappointing; and this with a 143 mile run in prospect on the morrow.

### Improvements.

That night several alterations effected a marked improvement; a hot air intake pipe was fitted, bending round behind the back cylinder, and about one and a half inches was cut off the induction pipe, this then being turned down in a lathe to accommodate the stump of the carburetter, which was thus brought into a position between the cylinders. On the following morning a start was easily effected by lightly priming the cylinders from the main tank and filling the float chamber with petrol from the small tank (the float chamber having been previously nearly emptied of the heavy fuel by allowing the engine to run itself out on the last occasion). The sidecar carried a cargo of spare cans of Binks fuel, about a pint of petrol in a bottle, kit bag, maps, a weight to help the controllability of the outfit in the absence of a passenger, and a windscreen (carried in its usual position, as the "Usual Passenger" was to be picked up later). The 143 mile run to the Midlands over the Holyhead Road was accomplished in the time expected, and a business appointment kept exactly to the minute. It was somewhat of a surprise to find the road in good condition, having regard to the present war conditions. The most noticeable feature of the run was the excellent speed maintainable on the second pilot jet (No. 3), but a knocking occurred on hills on the main jet (No. 7).

On the second day a further run of 151 miles to the South Coast was done, and Cheltenham, Stroud,

**1,200 Miles on Cheap Fuel.—**

Nailsworth, Bath, and Shaftesbury were all visited in turn. The same characteristics as in the previous day's run were reproduced, but as the hills were more frequent (the way to Cheltenham leading up the hill to Winchcombe, the widespread view from the top of which was greatly admired), the knocking occurred more frequently, although several small adjustments to the carburetter were made, and it was realised that careful experiment would doubtless effect a cure.

The destination that week-end was Bournemouth, and during the following week a trip was taken to Lyme Regis, accompanied by the "Usual Passenger" in the person of my wife. Now the road to Lyme Regis from Dorchester lies on the roof of Dorset; and you have to get there. However, the verdict of the "Usual Passenger," which should be received with all respect, was "very good." The steepest hills were taken on middle gear on the second pilot jet, and the run was practically a non-stop one in each direction. However, the knocking continued slightly on the main jet when going uphill.

**A Larger Main Jet.**

Further details of the return home—a journey of ninety-five miles from Bournemouth—and the subsequent week-end run back through Mid-Sussex, Fareham, and Southampton need not be entered into except to say that Bury Hill, north of Arundel, was climbed in the usual excellent style. I had unfortunately left the spare jets behind the previous week, but now fitted a No. 9 jet in the main—i.e., two sizes

larger than No. 7—and on the last run taken, but with an empty sidecar, the larger jet effected decided improvement in the running of the engine, the knocking having decidedly decreased, but the extra air lever was called into use now and then.

To sum up, the results obtained with the cheap fuel are as follow:

Mileage travelled to date.	Jets	Nos.	m.p.g.
1,263	...	00	58½
		3	
		7 (now 9)	

The engine had been decarbonised just previously to the arrival of the Binks fuel, and after 1,100 miles running the engine was again taken down and cleaned. The carbon deposit found was no more than when petrol was used, but the absence of a gauze screen in the hot air intake (since fitted) was responsible for an increased amount of road dust found, chiefly in the inlet valve chambers.

The writer has covered upwards of 10,000 miles on various machines purely as a private rider, and, though not a novice, has no curiosity to "see the works" so long as things are well, but he is a sensitive rider who can quickly recognise any deficiency in the running, and occasionally, in the opinion of the "Usual Passenger," nearly degenerates into fussiness. The result of the experience gained is sufficiently good to justify the continued use of the fuel, and it will be interesting to see how the machine behaves during the colder weather of the winter months which are now before us.

F.J.P.

## H.M. the King Inspects Motor Sections.

IT is not generally known that the first inspection of troops by Mr. D. Lloyd George after he took up his new office as Secretary of State for War was the Heavy Section of the Machine Gun Corps. It has been stated in the press that when Mr. Lloyd George reviewed the Australian troops a few days ago it was his first official appearance among the troops, but such is not the case, as he visited the Armoured Car Section of the Machine Gun Corps at its training camp and saw a demonstration of the vehicles forming the equipment some days previously.

The men of this section, it may be added, are mainly motor cyclists and motorists originally intended for the Motor Machine Gun Service. They were recruited and examined by Mr. Geoffrey Smith, Editor of *The Motor Cycle*, who recently received a letter from Lt.-Col. R. W. Bradley, D.S.O., containing the following extract:

"I must place on record my high appreciation of your work—both for the Motor Machine Gun Service and for the Heavy Section Machine Gun Corps. The raising of the latter Corps within the time limit available would not have been possible but for your valuable assistance."

It may be remarked that, since Mr. Lloyd George witnessed the demonstration of the Heavy Section, Machine Gun Corps, His Majesty the King has also visited the camp on the occasion of a field day of the Corps, and was delighted with what he saw, finally shaking hands with the officers.

This is another feather in the cap of the Motor

Sections, for, as we have already stated, a battery of the Motor Machine Gun Service which went to the Front at the end of 1914 proved to be the first representatives of Kitchener's Army to go overseas. The battery in question, No. 1, was commanded by Captain R. J. Colson, now Lt.-Col. and Commanding Officer of the Training Camp.

## THE CAUSE OF OVERHEATING.

### A NEW THEORY ON A VERY VEXED QUESTION.

THE question of overheating has been much discussed, but is always interesting. It will, I think, be agreed that there are at least two types of what is known as "overheating," each of which represents certain typical phenomena. We have instances where an engine, when driven hard, commences to knock, and again we get cases in which the engine simply peters out without any sign of a knock. Now the first condition is, I think, almost certainly due to pre-ignition. It would seem probable that some internal part of the explosion chamber becomes heated to such a temperature that when the gas is compressed its temperature just round this heated part is raised to a point above its temperature of ignition. The mixture in this way is fired just as if a spark had passed at the plug points, the only difference being that the ignition takes place too early, which results in a very sudden shock being given to the piston and other parts which are moving with it. The whole phenomenon is pretty simple, and can be brought about at will by advancing the ignition too far.

The second condition is, however, considerably more puzzling. There is no suggestion of early ignition, and, in fact, when matters reach their worst state there is apparently no ignition of the mixture at all. The engine simply stops firing.

I think most motor cyclists who have done much riding will remember cases when, after having travelled all out either on the level or up-hill for a considerable distance, their machine has commenced to slow down, and has finally stopped entirely. In these instances there is no trace of knocking, the first noticeable symptom being a slowing down, and a feeling as though "all the power had gone out of the engine." The explosions become muffled and woolly and then cease.

#### Two Suggested Explanations.

I myself have had motor cycle engines which did this, and I have also noticed the same thing on a cycle car, though in this case the engine did not stop entirely. The particular car to which I refer had a practically open exhaust, and made a particularly healthy noise. Whilst climbing a long and very severe gradient the exhaust gradually tailed off until at the top of the hill it could hardly be heard. The climb was made on second and first speed with the throttle almost fully open the whole way. I think from this description the reader will be able to recognise the particular type of overheating to which I refer.

Now I seem to have seen two suggested explanations, which were as follow :

(1.) That, owing to the heat of the engine, the incoming charge becomes expanded so much that the amount (weight) drawn into the cylinders is too small for the development of any appreciable power.

I do not think this explanation can be correct. The velocity of the gas passing into the cylinders when the engine is running fast is great. The gas is a bad conductor of heat, and one does not see how in the exceedingly short space of time during which it is in contact with the hot walls and passages of the cylinder it could become sufficiently attenuated to produce the phenomenon in question.

(2.) *Defective Lubrication.*—This, I think, is certainly not the cause. It is difficult in the extreme to see how this could cause a failure of the engine to fire. One would expect the result to be a general tightening of the moving parts—the piston in particular—in fact, an extra load on the engine. It should bring the machine to rest more or less gradually, but there appears no reason why the engine should cease firing.

#### A Likely Theory.

I will now turn to what I think may possibly prove to be the real explanation. During the course of some investigations on an entirely different subject I had cause to examine the sparks produced by an induction coil between the ends of two wires separated by about .5 mm. The examination was made under a microscope specially rigged up for the purpose. The apparatus was so adjusted that the strength of the current producing the sparks was perfectly under control. When the current was fairly weak the sparks presented more or less the normal appearance, though many minor points of interest were observed, which it is unnecessary to enter into here. Matters continued thus until the current was increased to a value at which the ends of the wires commenced to glow a dull red colour. The sparks then became much less sharply defined, and presented a more or less nebulous appearance. On further increasing the current until the electrodes were bright red the sparks disappeared entirely. This phenomenon is, indeed, entirely in agreement with the well-known fact that at high temperatures gases become quite good conductors (comparatively speaking) of electricity.

Now these experiments were conducted under normal atmospheric pressure, and since the conductivity of a gas varies inversely as its pressure (within

**The Cause of Overheating.—**

limits), it occurred to me that it was worth while seeing whether a similar effect could be obtained in a gas when under increased pressure. I accordingly constructed a glass tube, containing two suitably placed electrodes, which could be filled with gas at a pressure of about 30 lb. per square inch. An examination was then made under these conditions, when very much the same effect was obtained, though in this case the temperature before the sparks disappeared was higher.

Now I think it will be clear from the foregoing that I suggest that in the case of a petrol engine the points of the plug, and as a result the gases in their immediate neighbourhood, become so hot that they (the gases) present no considerable resistance to the passage of the current. Under these circumstances the current does not pass in the form of a spark, but rather as what may perhaps be termed a "silent" discharge.

The heat developed by a given current varies directly as the resistance through which it passes, and in this case, the resistance being small, the amount of heat developed is small—in fact, too small to raise the gases to their ignition temperature. Of course, this theory requires the plug points to be hot, but not necessarily so hot as themselves to ignite the gas. I am quite ready to admit that the whole question requires careful investigation before any real reliance can be placed on the results. One wants to know the temperature of ignition of the compressed gases, and also the minimum temperature of the gases between the electrodes to prevent a spark passing. If the latter figure is higher than the former the theory is exploded;

if, on the other hand, the converse holds, then the gas will not be exploded.

**Further Investigation Necessary.**

Unfortunately I have neither the time nor the apparatus to investigate these two points. I am tempted to bring forward the facts as observed and the suggestions resulting therefrom in the hope that some comments may be made which may serve to clear up a matter still shrouded in mystery. I have entirely omitted one consideration, viz., that the insulation of the plug may break down in many cases at a high temperature. Perhaps after all this may prove to be a sufficient explanation. However, that is a question which I would leave to those more capable of expressing a definite opinion. I used in all cases a 2in. objective in the binocular body of my microscope; of course, the binocular instrument gives a much more satisfactory result than the monocular, but is not in any way necessary, and I think an ordinary magnifying glass, magnifying about eight times, would give a fairly good result, though I have not tried it. If a small coil is used, the electrodes should consist of very thin wires, say number 36 or 40 S.W.G. copper. The current from a small coil is not able to heat up thick electrodes, whilst in the case of a plug in an engine, the points are heated by the explosions.

If a microscope is used it is well to connect it by a wire to a gas or water pipe, as in the event of one of the wires from the coil coming into contact with it, a very unpleasant shock will be experienced when making an observation unless the instrument is earthed.

C. H. STEPHENSON.

A TYPICAL DUTCH ROAD RUNNING ALONGSIDE A CANAL.

The photograph was taken during the Assen meeting. This meeting consisted of a reliability trial, a fault-finding competition, and a fox and hounds race. The disc wheels of the front machine are worthy of note. The inset shows a competitor in the fault-finding competition with his Triumph, the rider being Mr. Henri Meyer, editor of "Het Motorrijwiel," who will be remembered by competitors in the Anglo-Dutch trials.

# THE MOTOR CYCLE IN JAPAN.

## A. Motor Cyclist's Impressions of the Fine Scenery and Difficult Roads.

**M**OTOR cycling is becoming increasingly popular in Japan, not only amongst the resident foreigners, but also amongst the Japanese themselves. Prices run rather high, owing to the cost of freight and the import duty of ¥90.00 (about £9 ros.) per motor cycle of any power. This fact alone debars all but the relatively small moneyed class from the pleasures of motor cycling. This is easily understood when it is considered that the average monthly income of a professional man, say a doctor, is but £10, and that of a clerk about £4.

As examples of the prices of new machines ruling before the war, a 2½ h.p. Douglas two-speed kick starter cost about £62, and a 3½ h.p. B.S.A. with three-speed hub gear cost about £76. The agents for the various makes of machines carry practically no stocks of spares, and competent repairers are very few.

The female Japanese rider has not yet appeared, and I am convinced will not appear for a few generations to come, as the woman occupies a very low position in the relations of the sexes.

There are many drawbacks to motor cycling in Japan, the foremost being the roads and the native road users. The few main roads are reasonably good, but are spoilt by the extensive use of loose gravel, which, thrown periodically upon the road surface, is left to the traffic to roll in. As the road traffic is very light, this operation takes a considerable time to complete, by which time a fresh lot of gravel is due.

There is, it is rumoured, actually a steam roller in Tokio, but it is not used because the road bridges are unable to carry it.

### Japanese Roads.

The roads have no foundations, and consequently break up badly in the wet weather or under heavy traffic. In the country the bridges are usually crazy wooden structures, very shaky, and with always a modicum of loose or rotten flooring planks. Ferries abound, and in flood times, when the rivers are swollen to a breadth much greater than normal, they are very difficult to negotiate. Many of the bridges disappear entirely during the wet weather, as also do whole stretches of the roads. In the dry weather the dust

is very thick, and in the wet weather the roads are seas of mud.

Amongst the hills and off the main roads fine scenery is to be found, but trials and tribulation await the bold wanderer off the beaten tracks. Ferries with precipitous approaches, water splashes, narrow serpentine tracks, rising and falling at terrific grades, loose stones and boulders, mud, gulleys, river beds, and hysterical pack horses all go to spice the journeyings of the intrepid motor cyclist who forsakes the main roads. These exploring expeditions are not without their charm, however, despite the adverse road conditions encountered. I advisedly designate these trips off the main roads "exploring" expeditions, because of a complete absence of really truthful maps: that is, truthful from a motor cyclist's point of view.

Except in a few of the most important cities there are no rules of the road. In the country the people have no conception of a speed above that of a trotting rikisha man; consequently they are very sluggish in making way for an approaching motor cycle, and, generally, when the motor cycle is all but upon them they are seized with panic.

The traffic mostly met with consists of hand carts, two-

wheeled horse carts, pack horses, rikishas, and four-wheeled omnibuses called "basha." The last-named are only encountered about the larger towns. Their speciality act is that of obstructing motor vehicles, but a liberal use of horn and cut-out almost invariably reduces the horse to such a state of nerves that, rather than endanger his passengers, the "basha" driver instructs his horn-boy to alight and hold the plunging horse until the motor cyclist is safely by. On occasions I have seen the "basha" driver, on hearing an approaching motor cycle, actually take his horse from between the shafts and lead it into a near-by field in order to avoid the bout of equine hysterics likely to ensue should the motor cyclist pass too close to the excitable quadruped. The horn-boy referred to above is generally a diminutive ragged youth who trots before the "basha" blowing a strident horn, when passing through towns or villages, in order to clear a way for the ramshackle vehicle. This is made necessary by law for the "basha," but

Interested villagers at Toya, showing author's Brough motor cycle in the foreground.

**The Motor Cycle in Japan.—**

does not apply to the speedier motor car. The speed limit for the latter, however, is 12 m.p.h. Needless to say, this limit is habitually exceeded by car drivers.

**The Animal Population.**

Horses, generally, in Japan, being totally unused to the sound of the exhaust from a petrol engine, shy

Pontoon bridge over the Tangawa river at Furuto.

violently upon the approach of a motor cycle, and cause considerable anxiety to both drivers. The effect of a plunging horse attached to a two-wheeled cart

The Tokido (Japan's main thoroughfare), near Hiratsuka, in flood time.

carrying long bamboos, or an excited, overladen pack horse with nothing to restrict the full use of its hind legs, when encountered upon a narrow road, can better be imagined than described.

The people, however, are generally very helpful and considerate to the motor cyclist in trouble or enquiring the way. A curious, jostling crowd always throngs round the halted motor cyclist. The various members explain the working of the machine to one another; burn their fingers on the engine; ask questions as to

speed, etc.; and unwittingly impede the rider's movements. On a sweltering summer's day these attentions are extremely exasperating, especially when one's temper has already been ruffled by the advent of a fault developing on the machine. But the crowd is quite amiable; not aggressive, but merely interested.

Punctures are very rare. The stones with which the roads are made up, being taken from the river beds, have no sharp edges; and the road surfaces being soft, the stones are rolled in by the vehicular traffic without being broken. As the natives use no nailed boots, very few nails are deposited upon the roads; and broken glass or jagged-edged tin cans, etc., are very rarely encountered.

**A Rise in Petrol.**

Petrol of a kind can be obtained in nearly all the towns and larger villages. It is used by the Japs for cleaning purposes, and is sold in one pint beer bottles.

Bridge at Tashiro swept away at flood time. Temporary bridge on left.

True, it is more often than not well flavoured with foreign solid matter, water, etc., but it serves its purpose. Imported Pratt's and Shell, or petrol pro-

A provincial hotel at Gotemba.

**The Motor Cycle in Japan.—**

duced in Japan, can be obtained in the larger towns in the ordinary four-gallon sealed cans. Petrol produced in Japan, which in pre-war days cost 5s. per four-gallon can, now costs 9s., and bids fair to rise yet higher in price.

Japan as a motor cycling country has its advantages, however. There is no speed limit for motor cycles, though "driving to the danger" is a punishable offence. The pastime of timing unwary motor cyclists over alleged measured stretches of road with 5s. Yankee watches is denied the police here. We carry no identification number-plate except a small wooden tag, which is, in effect, just a receipt for the tax, and need not necessarily be attached to the machine. The licence in this district is 10s. per annum for any motor cycle, plus a local tax of about 2s.

**An Ideal Mount.**

My specification for a suitable machine for solo riding in Japan is as follows:

**ENGINE.**— $3\frac{1}{2}$  h.p. opposed twin. Cylinders both easily detachable without removing the complete engine from the frame. Overhead valves. Valve gear protected, and provided with lubricators. Engine should not form a stressed member of the frame, but be independently attached. The outside flywheel should not make magneto contact breaker inaccessible.

**CARBURETTER.**—Fitted snugly against crank case, out of the way in case of a fall. Ample gauzes to keep road dust out of mixing chamber, and large area petrol filter.

**GEARS, ETC.**—Three-speed countershaft gear. Change lever should not prevent rider from gripping petrol tank with both knees. Gears  $4\frac{1}{2}$ , 7, and 12 to 1. Large diameter countershaft pulley. Handle-bar controlled clutch, capable of withstanding continued slipping without burning out.

**TRANSMISSION.**—Chain-cum-belt. Chain should be outside engine flywheel, and be enclosed in an oil bath case. 1in. belt, well protected from mud and rain. Belt rim attached to rear hub shell by independent spokes, and as small in diameter as possible. Large diameter belt rims become damaged when riding in deep ruts.

**WHEELS, ETC.**—28in. diameter. Tyres, 28in.  $\times$  2 $\frac{3}{4}$ in. or 3in., extra heavy. Rims extra strong, and of a width smaller than the sectional diameter of the tyre, so as to escape damage when riding amongst large loose stones.

**BRAKES.**—Enclosed band brakes on both wheels. Wheel and belt rim brakes are useless and dangerous when rims are at all battered.

**A Chain-mail Mud-flap.**

**MUDGUARDS.**—5in. or 6in. wide, almost flat in cross section, and at least 1in. clear of tyres. Side valances are useless, as they cause mud to clog, and make tyres inaccessible for repairs. Front mudguard should not be carried too far forward, but be bent upwards at a point immediately above the wheel centre. Indestructible mud-flap should be fitted to front guard: I would suggest a light steel chain-mail flap.

**FRAME.**—Loop pattern, reinforced, with front and rear springing. Springs must be very stiff. The usual

Druid pattern spring fork allows the front mudguard and base of steering column to come into contact when a bad shock is received.

**SILENCER.**—Fitted with extra baffle for making exhaust very silent when passing restive horses, etc., and which can be cut out for ordinary riding conditions.

**LIGHTING.**—In default of a really compact, powerful, and reliable dynamo lighting set, a powerful acetylene head light with large generator is essential, and a small auxiliary storage-battery electric head light would be very handy for use when passing through the many long dark tunnels met with on the main Japanese roads.

**General Requirements.**

There should be at least 6in. clear ground clearance

Ample petrol tank, not too wide about the rider's knees, fitted with large filler caps and petrol filter.

Large pan saddle well sprung; springs enclosed so that rider's coat tails cannot enter between the coils when springs are loaded, and so be caught when the springs are relieved by the rider dismounting.

Semi T.T. handle-bars clipped direct to steering head or forks, so that bars cannot twist when subjected to excessive side strain.

Footboards kept as high and narrow as possible. In deep ruts or amongst large loose stones footboards suffer badly if at all low or wide. A bar fitted across each board towards the forward end, against which the front of the rider's boot heel could rest, would assist to keep the feet from being jerked off the boards when riding over bad roads.

A complete set of the necessary tools, spanners, etc., should be enclosed in two ample pannier tool-bags of stout metal reinforced leather, kept flush with the sides of the rear carrier. A third bag should be fitted between the mudguard and back rail of carrier, and be divided into receptacles for carrying the necessary spares, a complete set of which should be included in the machine's equipment.

All black finish.

All bolts and nuts standardised, and fitted with locking devices, spring washers, or split pins.

Rear stand arranged to be operated from the saddle, so that when the rider is forced to stop suddenly on a steep hill the stand can be used as a sprag to prevent the machine from running backwards when gear is put into neutral to restart the engine.

A mechanical horn on the lines of the "Auto Vox" (in which a friction pulley driven by the engine flywheel causes an air current to pass through an ordinary reed) would be a useful fitment. Such a mechanical horn could be made very small, and could be tucked away under the forward end of the tank.

I am convinced that by paying special attention to such small items as control levers, lamp and speedometer fittings, etc., by substituting neat brazed lugs for loose clips, and by making the accessories suit and fit the machine, much could be done in the way of weight cutting without reducing the strength.

The foregoing specification appears to me to voice the requirements of the general run of overseas motor cyclists, judging from the letters reproduced from time to time in the much appreciated Overseas section of *The Motor Cycle*, and by my own experience in Japan.

E. V. STEVENS.

## MILITARY NOTES.

## News of Service Motor Cyclists in Egypt, France, and German East Africa.

## CONDITIONS IN EGYPT.

THE name of A. G. Fenn will be familiar to many readers, as he took part in numerous competitions in the pre-war days. At the moment he is a driver in the A.S.C., M.T., and stationed in Egypt, whence he has sent us some impressions of Army life.

The following are extracts from Fenn's letter, which has been passed by the British Press Censor:

"I do not suppose you hear much of what goes on in Egypt, as I see very little mention of affairs here in the English papers; but you must not be surprised at the magnitude of operations when you eventually learn the truth, which, I suppose, will be published one day.

"It is insufferably hot here just now, although up to six months ago it was fairly respectable. In the towns it is not so bad, but out in the desert the heat seems to be magnified tenfold, as though we lived in the focus of an immense mirror. Temperatures of 120 degrees are not at all uncommon, and it is no joke when anything needs repairs, which, fortunately, is not too often. On the whole, the War Office has selected some of England's best in the M.T. line. I have had Vauxhalls, Sunbeams, Daimlers, Fords, Austins, etc.—of all sorts of ages and respectability—lorries, a Holt Cater-

pillar, and even an afternoon on a steam roller! The chassis number of each car I write down in my diary (not counting the roller), and perhaps I may run across some of them in future years.

"I could tell you all sorts of falsehoods about hairbreadth escapes from fanatics and howling Dervishes, but, to be quite candid, I have not had, nor heard of, anything of the sort since I have been out here. Shells we have, and occasional visits from enemy aeroplanes, but, beyond a bang or two in the distance, there is nothing which could be magnified into war horrors. Of course, we sometimes find ourselves in an irrigation canal at night time, when we have no lights, or get stuck in the sand, and go hunting for camels, which is really great fun, and helps to pass the time, but nothing sufficiently exciting for me.

## The Dreaded Sandstorm.

"What we dread most is a sandstorm. When we get caught in one of those it is as near hell as matters not. The hot wind seems to blister one, and the sand gets in everywhere—goggles, eyes, ears, throats. We simply cannot drive in one, and have to wrap ourselves up in our side curtains and wait until it stops.

"But for these, and the specially designed insects which seem to have been invented expressly for troops, we should be quite contented; as it is we

are all right. Literature is expensive where I am; a copy of *The Motor Cycle* costs me 5d.

"I managed to pick up a 1915 Indian at a reasonable price when I was in the nearest town, but do not get much chance to use it because we are so busy. The chains take some protecting, for we have over two miles of sand to get over somehow before we strike anything in the least resembling a road. What a game!"

## THE MARRIAGE OF MAJOR WATSON.

WE offer our congratulations to Major W. H. L. Watson, the author of "The Adventures of a Despatch Rider," on his marriage to Miss Barbara Wake-Walker. Major Watson went out in the early days of the war as a despatch rider (corporal R.E.), and later on transferred to the Army Cyclist Corps. His delightful book, which we reviewed in the early part of the year, is a true record of the excellent work of the motor cycle despatch riders.

## MORE GERMAN EAST AFRICAN EXPERIENCES.

AS a sequel to the article on page 160 of *The Motor Cycle* of August 24th, describing the experiences of a motor cyclist serving in German East Africa with Gen. Smuts's troops, we now reproduce a letter from another man serving with another light armoured battery in the same country. The writer of this second letter is Sgt. Bilbe, at one time a technical journalist, and before the war a leading light in the Endrick Engineering Co. The two articles together assist one in realising the enormous transport difficulties that are being overcome in this campaign; also the super-severe testing the motor cycles are getting.

Sgt. Bilbe, L.A.B.

The letter is reproduced herewith practically *in extenso*, after being passed by the British Press Censor:

"Three days since I received *The Motor Cycle* for February 10th, sent on from training quarters at home, and this reminds me that I might have advised you that I left there on February 4th. I had put in some seven months, mainly as sergeant-in-charge of the armoured shop, which was responsible for the production of some good things in the way of machine gun hand carts and some other things which one must not particularise.

"There were sudden changes made at the end of January, and I found myself appointed to this battery, which, along with another L.A.B., left home on February 4th. We came out to Mombasa via Cape Town and Durban, along with the cars and motor cycles, and had quite a good passage, as the company

## THREE-WHEELERS ON WAR WORK.

Both the War Office and the Admiralty employ numbers of Auto-Carriers for express delivery purposes. Our illustration is from a snapshot taken a few days ago in Kingsway, and shows a War Office Auto-Carrier loading up.

**Military Notes.**

on board was not large enough to cause uncomfortable crowding. We came up country—partly by rail, rest by road—at the end of March. At present we have not seen any actual fighting, having been in reserve, but two other batteries (one Sir John Willoughby's) have taken part in recent advance work, and, I believe, done very well.

"Life with this battery is by no means unpleasant. We get excellent rations, including soap, tobacco, and matches, and can obtain extras, such as tinned fruit, sardines, pickles, etc., at various stores, which spring up under the control of enterprising Indian traders or the Y.M.C.A. at almost every place where there are troops. On the trek the men have perforce to rough it a bit, but in the camps everything is done for their health and comfort. The climate is good, and here on the high plateau, over 2,000ft. above sea level, the heat is not excessive, and we are all fairly well used to it, though topees and spine protectors must be worn.

**Road Conditions.**

"The rainy season, which should have ended some three weeks since, but is lingering on in some districts, held up operations. The roads are, of course, unmetalled, simply worn tracks, and on these the mud was very bad; indeed, it is still so in many parts, though not here. To get about at all on the Douglasses during the rains the mudguards had to be removed, as they clogged up. Most of the riding now is over bush, and for this the machines have been stripped of the front guard and the mudshield, while the back guard has been cut at the centre of the carrier, and only the tail piece with the stand clip retained. Most of my work is in connection with the motor cycles of the battery, and I have done some riding. The roads are better than one would expect, the deep sand patches being the worst feature. Riding through the bush is distinctly exciting, and the tyres get stuck full of thorns, yet very few cause punctures. Bent footrests are pretty common, of course.

"The armoured cars have done quite good work here, and can operate well in the bush. Possibly the most suitable type has not been evolved yet, but the moral effect on the blacks has been enormous; they call them rhinos, as the armour is proof against anything except pom-poms or shell fire.

"There is a depot of the R.F.C. here, and this is provided with P. and M. machines, one or two with sidecars. It is a remarkable thing that these machines (P. and M.) are invariably run as supplied, i.e., with mudguards, etc., and also are kept scrupulously clean, presenting a contrast to most other makes, which, whether in the original finish or daubed over with khaki paint, usually are stripped, almost always damaged somewhere, if only footrests bent, and invariably dirty. It should, however, be remembered that the work of the P. and M.'s is mainly that of carrying messages, etc., in the vicinity of the depots. We get all sorts of transport—long Cape waggons with strings of twelve mules or oxen, Ford cars, heavy motor lorries, some trailing howitzers, and there is a rickshaw (commandeered from somewhere)

which is driven behind two mules, sometimes as a pair, and at other times as a tandem by two officers, who run a fair risk of the affair tipping up and dropping them on their heads.

"This is a great country for game. I have been out after buck and zebras, and have seen the spoor of lions close to camp. Unfortunately, hunting has now been prohibited, and the only chance of getting any sport is when on the move."

**A LETTER FROM SALONIKA.**

**A**MONG our Service letters the other day was a communication from an R.E. officer, a former despatch rider, who went out with the original Expeditionary Force. He is now a lieutenant R.E. in charge of Signals with the British Force at Salonika. He says: "We are still 'carrying on' with motor cycling here. The roads are beyond description. I do not think the people at home quite realise the kind of tracks we have to ride over. The 'Six Days' are play to it; the hills are not bad either. We have one run with a hill very nearly up to Applecross standard. The Triumphs are good, but have not a great amount of crank case clearance, and the spring forks give a certain amount of trouble; they are always strapped, which saves a good many springs.

**A Composite Machine Suggested.**

"I think the ideal machine, or rather, combination of machines, for this part of the world, or any part of the world, would be Rudge with I.O.M. frame, forks, and wheels, Triumph engine, countershaft three-speed or four-speed gear, and all chain drive, but with chain covers, not chain cases. Still, as we do not get what we want, only what we can, and not much of that, what is the use of day-dreaming?

"It is raining like the d—l at the moment, and I pity the poor D.R. who gets a long run to-night; the roads will

be in a lovely state, *mais c'est la guerre*. Things seem to be moving in France a bit. Well, the sooner it is over the better we shall all be pleased. I dream of a powerful twin and smooth straight roads.

"They are teaching the Serbs to ride, and are giving them new Triumphs—men who have never seen a motor bicycle before most likely, and they will have to ride over tracks which would make a 'way up' competition rider think hard, and brand new Triumphs I would give my eyes for."

**DOWN WITH FEVER.**

**W**E are sorry to hear that Cpl. A. J. Sproston has been down with fever contracted after six months' service in Mesopotamia. At the end of July he was recuperating in a hospital in South India and hoping to be sent home when fit. Sproston has seen service since the beginning of the war, and *The Motor Cycle* of July 27th last contained a vivid account of his despatch riding experiences in Mesopotamia.

**THE SOMME FILM.**

**A**LL motor cyclists should see the wonderful War Office film of the Battle of the Somme. In the very first picture thrown on the screen one sees some excellent riding by motor cyclist despatch riders. A column of troops is passing through a French village, apparently on *pavé*, while the side of the road is thick with mud. The troops naturally occupy the best part of the road, and the D.R.'s come swinging round the corner in the slish, and again swing off it on to the hard road. This is a fine exhibition of riding, especially when one sees it accomplished by one machine carrying a passenger on the carrier. One frequently sees a D.R. flash past in a picture so fast that one cannot distinguish the make of his machine.

COY. SGT.-MAJOR, SERGEANTS, AND SECTION LEADERS, MOTOR CYCLISTS CO. ADVANCED SIGNAL DEPOT, R.E., FRANCE.

Names from left to right—Back row: Cpls. H. G. Gray, J. S. Larking (New Zealand), G. Tranweiser (Canada), W. Pooley, H. A. Oakes (Canada), and L. W. Bates.

Middle Row: Cpls. Mendoza, E. Bartlett, E. C. Bromley (Canada), J. Lawrence and E. H. Beaton (Canada).

Front row: Sgt. F. Early, Sgt.-Maj. W. Jeffrey, Sgt. Moir, and Cpl. J. R. A. Savidge.

All these men ride Triumphs. We are indebted to Cpl. Savidge for the original photograph

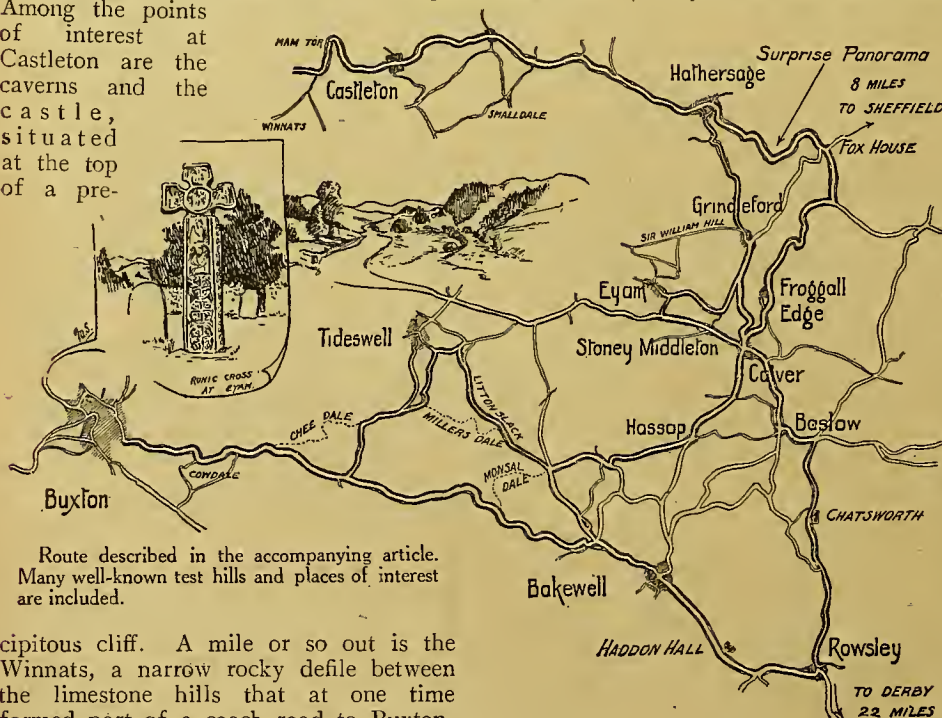

# THE CHARMS of DERBYSHIRE

**D**ERBYSHIRE and the Peak District have always proved a strong attraction for motor cyclists. The reasons are not far to seek, and may be put down to several causes, such as the grand scenery, the sporting hills that are to be found off the main tracks, the excellence of the main roads, and, above all, the historical associations of the neighbourhood. The principal places of interest are within easy reach of the big centres of population of the Birmingham, Sheffield, and Lancashire districts, and hence Derbyshire is a popular week-end rendezvous with riders from these districts.

A map reproduced on this page, together with the photographs, will be of interest to those riders who have not yet explored the delights of this section of the country, and the following notes may prove of use to those about to make their first visit.

## Outline for a Round Trip.

Castleton is a good starting place for Lancashire riders, who would reach it *via* Chapel-en-le-Frith. Among the points of interest at Castleton are the caverns and the castle, situated at the top of a pre-

Route described in the accompanying article. Many well-known test hills and places of interest are included.

cipitous cliff. A mile or so out is the Winnats, a narrow rocky defile between the limestone hills that at one time formed part of a coach road to Buxton.

The "Surprise" Panorama that one sees when travelling between Fox House and Hathersage.

It is now grass covered, but one or two climbs have been made by motor cyclists and described in these pages. The road to Tideswell provides another good test for the hill-climbing powers of one's mount, the surface being fair. This road was embodied in the 1914 A.C.U. Spring Trial.

Leaving Castleton by the Hope Valley one soon reaches Hathersage. A right-hand turn in the village leads to Grindleford and the well-known test hill, Sir William. The surface of this difficult hill has much improved since the days of trials, and is now in fairly good condition. The plague village of Eyam is reached from the top of the hill, and it contains many relics.

## More Hills.

There are two more good test hills at Stoney Middleton. From here the main Derby-Buxton road can be reached direct *via* Monsal Dale, though the better road is *via* Calver, Hassop, and Longstone to Monsal and Miller's Dale. The views in this neighbourhood are grand, and one of the best standpoints is a little to the right of the hotel at the Dale Head. There are various roads to Miller's Dale, one of them leading to the top of Litton Slack, another famous test hill. The valley can again be reached by an easier descent at the side of the hill, and the journey resumed through Miller's Dale, and so to Buxton.

**The Charms of Derbyshire.—**

Cowdale, approaching Buxton, is another hill for the gradient-hunting enthusiast, and on the other side is yet another, *i.e.*, Kingstondale. The best way is to go up Cowdale and continue along the road at the top, which will bring the rider down Kingstondale. Care must be taken to avoid missing Cowdale; it is about two miles from Buxton, on the left-hand side of the road coming from the south, and a farm gate has to be opened.

**The Descent Through Taddington Dale.**

Travelling southwards along the main road from Buxton, one has a grand run to Bakewell, including a magnificent two-mile descent through Taddington Dale, and a couple of miles further on is Haddon Hall, immortalised by Dorothy Vernon. A stop might well be made here to look over the beautiful old hall and its grounds.

At the station at Rowsley a left turn should be taken for Chatsworth (the road to the right leads to Matlock).

The run through Chatsworth Park is very enjoyable, and Chatsworth House is open to the public on certain days. Baslow

Approach to Peak Cavern, Castleton

is just north of the park, and the main road may then be followed through Calver until the junction with the Sheffield road is reached at Fox House. Here turn left and travel on to Hathersage and the original starting point, Castleton.

After passing over a stretch of level moorland road just beyond Fox House, a sharp turn in the road suddenly reveals a beautiful panorama, and if the day is clear a stop should certainly be made to enjoy for a few minutes the extensive view at this delightful spot.

When proved substitutes are available in abundance, tired munition workers might do worse than follow up this interesting circuitous route, which embraces the majority of the interesting spots of the Peak District. With a well-stocked

luncheon basket and fine weather, a very pleasant day's outing may be said to be assured.

**TYPICAL  
DERBYSHIRE  
SCENERY.**

(Top) Scene in Eyam, fourteen miles from Sheffield. The plague is said to have made its appearance in the cottages shown

(Bottom left) Foot of Hathersage Hill. The church in the background is well worth visiting.

(Bottom right) Grindleford Bridge, over the Derwent. "Sir William," a well-known test hill, commences to ascend in the village of Grindleford

" 6th	...	...	8.5 "

### No Competitions in New Zealand.

Owing to the fact that so many of the young men have enlisted, motor cycle competitions in New Zealand have been practically dropped, though an occasional meeting is held.

### Hobart-Launceston Record.

The motor cycle record for the road that separates the two principal towns of Tasmania changes hands at fairly frequent intervals. We hear that it is now held by Sidney Stearnes, a youngster of 17, who rode an Indian.

### Will it Come to England?

Motor races and aeroplane displays that were to form part of the programme of the American Liberty Day celebration at the Sheepshead Bay Speedway, near New York, on a recent Sunday, were called off at the last moment because the Sunday Observance Committee obtained an injunction. This is interesting in view of the opposition to Sunday competitions in England.

### The Bristol Avoiding Route.

We recommend motor cyclists journeying to the West, who wish to avoid Bristol traffic, on approaching the city from the Gloucester side to leave the main road at Filton, immediately after reaching the city tramways, by a turning to the right through the suburbs of Southmead and Henleaze to Durdham Downs. Continue with the open Downs on the right, past the Clifton Zoological Gardens, and Clifton Promenade, to the Suspension Bridge over the River Avon (tolls—motor cycle, 2d.; car, 6d.). Follow main road for one mile, and take left-hand turn through Beggar Bush Lane, down Belmont Hill (some care needed here), and join the main Weston-super-Mare Road at Flax Bourton. Turn away to the left, six miles on towards Weston, at Congresbury village, to join Bridgwater Road at Churchill. This route will be found to be full of interest, and abounding in pretty scenery, whilst traffic will be at a minimum. A pleasant diversion may be obtained by running round Durdham Downs—an extra two miles—the views over the River Avon and Bristol Channel from the sea walls being especially good, and many riders whose previous knowledge of the city is of the sordid tram ride through its slum districts will be agreeably surprised at its many beauties.

## SPECIAL FEATURES

ITALIAN MACHINE GUN SIDECARS (Illus.). THE CAUSE OF OVERHEATING.  
1,200 MILES ON CHEAP FUEL (Illus.).

### Trip for Wounded Soldiers.

It is proposed to arrange a Sunday afternoon outing for wounded soldiers quartered in Birmingham during September. Those sidecarists who are able to assist are asked to communicate with the Easting Windscreen Co., of 79, Colmore Row, who will arrange the whole affair, and, if possible, assist those who are held back by a shortage of petrol.

### A Fast Four-cylinder.

A four-cylinder motor cycle is hardly considered the mount for track work. Consequently, the performance of the rider of a four-cylinder Henderson in California is worthy of note. The Henderson was driven from San Francisco to Los Angeles, a distance of 462 miles, in 10h. 39m. This is an average of about 45 m.p.h. over roads of all kinds. It beats the previous motor cycle record by six hours.

### Improved Road Directions in the West.

During a week-end visit to the West we noticed improvements in signposting in the central parts of Bristol. This city, like many others of ancient origin, has retained a tortuous network of narrow streets, so much so, that strangers experience great difficulty in finding their way across the town. Recently signposts, giving many names and distances, have been erected at the principal junctions, notably at the Tramway Centre and Bristol Bridge, and motorists can now cross the city with a minimum of difficulty.

### A Missing Machine.

An Enfield two-stroke was let out on hire by the Manchester Motor Cycle Hire Co., 194, Oxford Road, Manchester, to a man who has deserted from the King's Liverpool Regiment. The fly-wheel is weighted with lead in the sunk part, and the cylinder head supported by an iron strap from the back down tube to the compression tap. Frame number 287, engine number 15,789.

### New Inner Tube after Excessive Pie Eating.

At a picnic of Portland, Ore., motor cyclists there were several competitions, one being a pie-eating contest. In this competitors had to lie flat on their stomachs, with their heads down hill and their hands folded, and gobble up blackberry pie without the use of their hands or rising up. The winner was awarded a new inner tube, for his motor cycle we presume.

### Making the Most of the Petrol.

One of the latest means for getting over the petrol shortage has been evolved by the Hercules Motor Spirit Co., of Blomfield House, London Wall, E.C. This firm is prepared to receive consignments of petrol, which will be mixed with a heavier oil, then treated chemically, and eventually returned to the owner. The mixture will show, we understand, an increase in bulk of approximately 50%, giving an appreciably greater mileage per gallon, and still retaining all those characteristics which render petrol suitable for internal combustion engines.

### A 1916 TRIUMPH IN SOUTH AFRICA.

W. E. Courtney, who won a gold medal in the hill-climb held on July 22nd by the East London M.C.C. Third, fourth, and sixth places were also secured by riders of Triumphs.

**The Removal of Toll-bars.**

The municipal authorities of Middlesbrough have, after obtaining Parliamentary powers, purchased five toll-bars within the borough, and freed the roads for good. This is certainly a commendable action.

**Supply of Petrol.**

Many wild rumours regarding the limitation of petrol supplies have been circulated for many months. For instance, one of the wildest, and one for which there is not the slightest justification, spread in the Wolverhampton district last week-end, it being to the effect that the prohibition of petrol for char-à-bancs joy rides, to come into force to-morrow, was to be extended so as to include motor cycles and private cars.

**Italian Machine Gun Sidecars.**

We are enabled to present our readers this week with a series of illustrations of the Italian counterpart of the British motor machine guns. A glance at the pictures on the centre pages will show that the Italian machines differ from ours in some points, such as protecting plates for rider and gun operator. But the main point is that the Italian Government has adopted the sidecar machine gun outfit, its choice doubtless being influenced by the numbers in use by the British War Office. In this connection, we may remind our readers that the originator of the sidecar machine gun outfits is Mr. Alfred Scott, designer of the Scott Sociable, who designed a Scott machine gun outfit immediately upon the outbreak of war.

**Road Warn'ngs.**

The following roads are bad and should be avoided: Basingstoke to Camberley, Guildford to Hindhead and to Haslemere, and Winchester to Romsey.

**New Indian Chief.**

Mr. John F. Alvord, head of the Splitdorf Electrical Co., has been elected president and general manager of the Hendee Manufacturing Co., Ltd., in succession to Mr. George M. Hendee.

**Petrol or Paraffin.**

A neat and effective method of using petrol or paraffin, or a combination of the two, has been invented and patented by Mr. Gordon C. Huffam, of 21, Meadway Court, Golder's Green, N.W. The device can be fitted to most carburettors, and is arranged to take the place of the usual jet attachment. In the main tank can be placed the paraffin or any petrol-paraffin mixture which is found suitable to the engine. A small subsidiary tank contains petrol for starting purposes; both fuels are turned on at the tanks, and the supply to the jet is then controlled by a tap below the jet. When pointing downwards this supplies petrol straight to the jet (not to the float chamber) for starting purposes. This makes it quite unnecessary to drain the float chamber before a start can be made—obviously a great convenience. A movement of 90° cuts off the petrol and connects the float chamber containing the heavy fuel with the jet. Another movement of 90° supplies a mixture of pure petrol and heavy fuel, which may be advantageous at times, and the fourth position can drain the float chamber, the petrol pipe having previously been disconnected.

Some members of a Motor Machine Gun Battery now in India, where the photograph was taken. Many of the men shown were formerly employed in Coventry motor cycle works. The photograph has been sent home by Pte. T. Collins, sixth man, standing, second row, reading from the left.

# "THE MOTOR CYCLE" RECRUITING SECTION.

## IMPORTANT WAR OFFICE DECISION.

Central Office for Motor Machine Gun  
Service:

Mr. Geoffrey Smith,  
19, Hertford Street, Coventry.

It was announced on this page last week that recruiting had been closed temporarily for the Motor Machine Gun Service. On Wednesday, August 23rd, an inspection of recruits was held at *The Motor Cycle* Offices in Deansgate, Manchester, when the following men were accepted, to report as accommodation becomes available.

G. W. Arthur, Walsall.  
H. Ashworth, Castleton, Lancs.  
G. H. Bradshaw, Manchester.  
C. Clarke, Salford.  
W. H. Cobbett, Woking.  
A. G. Dowding, Fulham.  
H. C. East, Coventry.  
F. Evans, Chorley.  
R. E. Graham, Padstow, Lancs.  
O. W. McIlraith, Bedford.  
R. G. Paine, Woking.  
R. Stewart, Ormskirk.  
G. Taylor, Oldham.

On Tuesday of this week another examination was held at the Coventry Recruiting Offices, and the names of those men enrolled will be announced in our next issue. At both inspections motor cyclists desirous of joining the Royal Engineers Signal Service as despatch riders attended, but the Training Centre of the R.E. is full up for the present.

On Saturday Mr. Geoffrey Smith, Editor of *The Motor Cycle*, received an important letter (reproduced on this page) from the War Office notifying a change in the system of recruiting motor cyclists, which all prospective recruits should carefully note. The official announcement means that the work of the various Motor Cyclist Reserve Committees will now come to an end in the matter of recruiting. The first step towards the change, it will be recalled, was the alteration of the Central Office for R.E. despatch riders

### MACHINE GUN SIDECARS FOR THE ITALIAN ARMY.

Bicycle side of one of the new Frera outfits, showing 90° 8 h.p. twin-cylinder engine and other details, such as carrier seat and rifles on rear of sidecar body. The "business" side of these machines is shown in the preceding two pages.

War Office,  
London, S.W.

22nd August, 1916.

Sir,

I am commanded by the Army Council to inform you that consequent on the introduction of the Military Service Act, the method of obtaining motor cyclists for Military Service will be arranged by the Commands as men are called up, and it will therefore not be necessary to make any further calls on your valued services in this direction.

The Council desire me to tender to you an expression of their thanks and appreciation for the most patriotic and cordial assistance which you have rendered, and to say that in view of the good work you have performed, they feel that if ever in the future they have need of your advice and help they may rest assured of your co-operation.

I am,

Sir,

Your obedient Servant,

*H. H. Currie*

Geoffrey Smith, Esq.,  
Editor "Motor Cycle",  
19, Hertford Street,  
Coventry.

some months ago from the A.C.U. offices in Pall Mall, where the secretary, Mr. T. W. Loughborough, was in charge, to the R.E. Signal Service Training Centre, Woburn, Beds. It would appear that henceforward motorists reporting for service will be allotted to any section which happens to be in want of recruits at that time.

Thus the Motor Cyclist Sections have been brought into line with Army Order 259 recently issued, in which it was announced that *all* recruits (line regiments, etc.), will be put into a general reserve, which will be drawn upon from time to time.

The number of applications from motor cycle and car driver recruits dealt with in *The Motor Cycle* Offices totalled 10,586 on Saturday last.

The Empire petrol economiser, described in our issue of August 17th, is sold by the New Motor Speciality Co., 43, Oxford Street, London, W.

## LUBRICATING DANGERS WITH PARAFFIN.

OWNERS who are seriously thinking of using either paraffin or one of the numerous substitutes as a fuel, whether neat or in a mixture of half and half, should bear in mind that their present oil is a great deal too thin for the work.

It must be remembered that this heavy fuel is found to take a great deal more vaporising than petrol, and some of it will undoubtedly get past the rings and thin the lubricating oil, when excessive wear will take place. The accompanying illustration clearly shows where the engine will be affected.

Our advice is to employ an oil of greater viscosity than is necessary with pure petrol. The excess paraffin mixing with this will thin it down to the right consistency, and the engine should not show undue wear.

H.M.

Showing where wear will appear if unvaporized paraffin impoverishes the lubricating oil.

## PETROL-PARAFFIN REGULATING DEVICE.

IN view of the small number, complication, and difficulty of fitting special paraffin vaporisers, Messrs. Bramco, Ltd., of Coventry, are introducing a very novel three-way adapter valve, to enable petrol and paraffin, or any other low grade fuel, to be mixed while running to the best advantage. For economy, of course, the greater proportion of paraffin or heavy fuel that can be used the better, but all who have tried know that an engine will run properly with a much greater proportion of heavy fuel when hot than when cold. Thus, unless some device is fitted which enables the proportion to be altered after a start has been made the greatest degree of economy, or the easiest possible starting from cold, is not obtained. This new device, which hails from America, where it has been used, we are told, with great success for

a considerable time, consists of a cross-shaped hollow casting, comprising three fuel unions with a control cock in the centre; the upper union is connected to the carburettor. The two horizontal unions are taken respectively to the petrol and heavy fuel tanks, while the arm on the right-hand side forms a drain cock enabling the supply pipes and carburettor to be drained of fuel. This is specially useful when it is desired to start on pure petrol.

The control cock enables the supply of either fuel to be regulated gradually from all of one fuel to all of the other, the two thus being perfectly mixed in any desired proportion before reaching the carburettor. Thus, a start can be made on pure petrol, and when the engine is warmed up the heavy fuel can be gradually turned on and the quantity of petrol reduced, and, according to the atmospheric conditions, the heavy fuel can be reduced or increased at will to enable the best results combined with economy to be obtained. This regulating cock is controlled from the handle-bar by means of a Bowden control which is marked with a graduated scale. This fitting, which sells at 55s., should certainly enable the best possible results to be obtained with fuel mixtures in conjunction with the ordinary carburettor.

## HIGH SPEEDS IN THE ARGENTINE.

A TWO days' race meeting was held by Buenos Ayres motor cyclists last month, the first half of the programme being held on the 16th, and the second half a week later. There were four classes, and the distance over which competitors were timed was, in all cases, a flying kilometre. The meeting is known as the "flying kilometre championship of South America," and this is the fourth year on which the gathering has taken place.

The racing was held on a paved road, with excellent surface, running from Buenos Ayres towards La Plata. Competitors, we understand, were allowed a flying start of the unusual length of two kilometres, and the timing of the measured kilometre was electrically controlled. Results:

### 3½ H.P. SOLOS.

1. G. Taron (Bat) .. ..	67.10	m.p.h.

2. A. Selmo (7 Excelsior) .. ..	85.00
3. R. Reganti (7 Indian) .. ..	75.00

Santiago, winner of the open class, has now held the championship for three years in succession. He also improved considerably on his last year's time, which was 75.5 m.p.h. A very strong side wind blew on the day the two last classes were run. The highest speed made at Brooklands on a motor cycle is 83 m.p.h., also an Indian.

Bramco arrangement for control of petrol and paraffin mixture.

## STRAINING PARAFFIN.

A CONTRIBUTOR in referring to the use of heavy fuels makes the following suggestion for improving paraffin for use as a fuel. The idea, if not sound from the point of view of making the fuel more explosive, would certainly have the advantage of removing any dirt or impurities which are very likely to be present in common paraffin. He states that "Chamois leather strainers were largely used in America a year or so ago for petrol. The practice was, however, given up owing to a large number of accidents, due, it was said, to the fact that the leather had a certain chemical action on the petrol, which, for some un-

Apparatus suggested for straining paraffin through chamois leather.

known reason, caused it to become excessively explosive, and it is suggested that straining paraffin in a similar manner might have somewhat the same effect.

As paraffin is rather a dense fluid there is a difficulty in getting it to pass through the leather, so he has devised a simple apparatus for overcoming this difficulty. A large tin is obtained from which the bottom is removed or perforated with holes. Next a plunger must be made and weighted to the extent of about 20 lb., which should be sufficient to force the paraffin through the leather.

The Editor does not hold himself responsible for the opinions of his correspondents.  
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Petrol Allowances.

Sir,—Here is a point *re* the new petrol regulations that occurred to-day. I am allowed two gallons a month; I have had half a gallon; on going into a garage to ask for one gallon I am refused, because the management will *not* open a tin for anyone. They say it is impossible to get four separate half gallons out of one tin! I could not take the tin because I am half a gallon on the wrong side! In any case my tank only holds one and a half gallons. If this standpoint is taken up by the garage people, I am afraid many motor cyclists will find themselves in the cart.

SMITH WHITING.

#### Cultivating Overseas Trade.

Sir,—Referring to the article on the Colonial motor cycle market and Mr. Clarkson's views, on page 155 (August 24th), it seems to me, as a motor cycle rider, that the only way to secure the Overseas market is for English manufacturers to agree to put some of their best ideas in a common pool, in the same way as has been done in other trades.

How would a motor cycle combining the following do: 6 h.p. A.B.C. engine, Sunbeam oil bath gear cases, Enfield spring handle-bars and lubrication, leaf springs front and rear, four-speed A.B.C. gear box, Coventry Silent chains, Lucas electric lighting set, automatic carburettor, two tanks for petrol and paraffin, combined rubber and steel-studded tyres, valve springs enclosed, spring-up stand under engine, etc.?

A. FEIRON.

#### Petrol Waste.

Sir,—We have noticed references at times in the press as to whether it would be possible to run motors on ordinary coal gas. We submit rough sketches of the ideas of a

member of this firm, which were about to be tried out when he was called up. It is obvious that motor cycles can either run on petrol or coal gas independently, or a mixture of both at the same time; or the motor cycle can be run on the coal gas until the engine is hot, and then ordinary lamp oil used.

There is a little screw under the jet in most carburetters that can be taken out and a union for the gas supply screwed in. The tap necessitates an extra control from the handle-bars. When running on gas only, the throttle can be left wide open and the running controlled by the air and gas tap controls. The compressed gas cylinders can usually be obtained by any dealer in magic lanterns. A larger jet should be used in the carburettor.

No patents have been, or are being, applied for any application of this.

GREEN TAXIS.

#### Steering Head Design.

Sir,—With reference to recent articles on the above subject, I would suggest that the ideal bearing for the motor cycle steering head is the Timken adjustable taper roller bearing. These bearings, standing up as they are in everyday use in commercial and other vehicles, are infinitely preferable to non-adjustable ball bearings, and much preferable even to adjustable ball bearings; for both these bearings are working under almost impossible conditions for small oscillations, when both races have only a very small part of their surface and one or two balls at most under stress, reducing the proverbial line contact to a point contact *till* they dig a little hole.

PIECAN.

#### 520 Miles on Four Gallons.

Sir,—I notice that "Ixion" has a short comment on my ride from the Midlands to the West and back. I may say that I was myself surprised at the excellence of the consumption figures in view of the large amount of low gear work necessary, although this was to some extent neutralised by being able to run down most of the long Dartmoor hills in "free engine." I have heard of a similar machine doing 140 m.p.g., but cannot vouch for this. Will "Ixion" please note that I am not under the impression that a petrol can holds a gallon?—a misapprehension which has been in the past responsible for some rather extravagant claims. I cannot get the same consumption on short runs, but my last tin of petrol carried me 232 miles, daily distance about eleven miles; two starts, sometimes three.

When "Ixion" says that he suspects me of being "a member of that small majority who retains some respect for the legal limit," I do not know whether he speaks with approbation or a veiled contempt. I should like to believe that it was the former, but I fear that the latter is more likely. My favourite speed in the country is from 30 to 35 m.p.h. This does not mean driving all out, which I dislike, and the engine runs very nicely at these speeds. In towns my speed is moderate. There is, I think, no excuse for lurid cornering in crowded streets.

AURIGA.

#### American Motor Cycles.

Sir,—With reference to "H.E.R.'s" letter on twins and Mr. Brocklebank's letter on the same subject, I think your editorial comment about hits the mark. To compare these over-engined crudities with the average clean designed and sweet running English machine is absurd. With Mr. Brocklebank's dictum, that the three most popular singles are the worst, I, guessing well the culprits, agree. I would point out that people who follow the crowd and are content with "the three most popular singles" deserve all they get.

1. Twist grip controls. A system of control that means contorting one's wrists into the position of least muscular efficiency whenever the inevitable emergency crops up.

2. Crude kick starters or even dangling pedals, abandoned in England a few years ago. Where are the much boomed electrical engine starters? I would ask.

3. Constant attention is necessary to the average American engine, if used daily.

4. These carburetters are automatic mostly in name.

All these factors will prevent my ever purchasing anything from across the herring pond. When America can produce a Levis or Connaught, a 2½ h.p. A.J.S. or Douglas, a Norton, Sunbeam, or A.B.C., an A.J.S., Scott, Enfield, or Matchless, then I will possibly change my mind.

B.E.F.

A. LINDSAY (CAPT. R.G.A.)

### Petrol and Paraffin Tests.

Sir,—As the question of paraffin as a substitute for petrol is being widely discussed by the motor cycle community at the present time, the following results of tests made with cheap fuel may prove of interest.

Paraffin-petrol mixtures (Parapet—why not?) having been used successfully for some months by the writer but no record made of their efficiency, it was decided that an accurate test should be made with an 8 h.p. Zenith and sidecar and

Warming a carburettor by means of a flexible tube from the exhaust.

a 2½ h.p. French Zedel lightweight. Both machines were fitted with B. and B. carburetters, the large one having a simple heating device which could be cut out at will. This merely consisted of a flexible metal tube wound several times round the petrol feed pipe, carburettor, and induction pipe, and connected to the exhaust.

To obtain equal throttle setting in each test a stop made of brass strip was attached to the handle-bar control. A three to four-mile stretch of country road in Essex was selected, having, with the exception of one hill (gradient 1 in 9), a practically level and good surface, and which, being a by-road, was devoid of traffic.

The test was then carried out in the following manner: Two gills of Pratt's No. 2 were poured into the empty tank of the Zenith, a running start made, and the throttle opened as far as the stop would permit. The road being level a constant speed of 31 m.p.h. was maintained until the pre-arranged accelerator mark was reached, when the throttle was opened fully and the maximum speed logged.

The position of the necessary gear change was marked by the passenger dropping a large white stone overboard at the moment of changing.

Upon reaching the summit of the hill the original setting was reverted to until all the petrol was consumed, which consumption worked out at 62 m.p.g.

Similar tests were made with the other fuels as shown, the engine being allowed to cool down between each. The heating attachment was next brought into operation and the test repeated. Tests were then made with the lightweight machine, but with standard carburettor adjustment.

It was noticed, when using paraffin mixtures with the standard carburettor, that starting was difficult, acceleration poor, and a choking effect apparent at full throttle.

With "Spots" treated petrol no difference was noticeable, but with "Spots" and paraffin the choking completely disappeared, but no increase in mileage was shown.

For those wishing to retain the same degree of liveliness, etc., as obtained from petrol, with a saving of 10½d. a gallon, a 50% "parapet" mixture used in conjunction with a simple heating device, as shown, is recommended.

A liberal injection of petrol will ensure easy starting, and once the engine is thoroughly warmed up the acceleration will be as good as can be desired.

With regard to carbon deposit, the writer's 8 h.p. J.A.P. engine was dismantled after running 3,000 miles on this mixture and the usual amount of deposit was found, whilst the piston and rings were by no means lacking in oil.

A. WARD.

### Paraffin as a Fuel.

Sir,—I have watched with much interest the alarm amongst motor cyclists re reduction of petrol, and herewith enclose a diagram showing how I get over the difficulty.

I run entirely on paraffin, and find starting and running quite easy and no depreciation in power in hot weather.

On early mornings and late nights I find I occasionally require to start on petrol, and so have fitted up my Sunbeam, as shown in the diagram, with a cylindrical tank (clipped beneath the frame and holding three pints of petrol), a four-way union having a tap in the bottom, a petrol pipe from the small tank, a pipe from the main paraffin tank, and a pipe feeding the carburettor.

In cold weather, when starting is a little difficult, I drain the carburettor of paraffin from the tap, replacing fuel in the main tank. Flood with petrol, then turn off petrol and turn on paraffin. Starting is then easy, and change of fuel is gradual.

I have tested this method for some time on Triumph, Bradbury, and Sunbeam bicycles, and find it acts splendidly. I fitted the device myself, and the cost of tank, pipe, and fittings amounted to 11s. 6d., and I soon saved this in the difference in the cost of fuel.

T. BURBIDGE.

Sir,—May I just give the following hint for the benefit of readers who may be using paraffin or paraffin mixtures. I met a novice the other day on a 1915 3½ h.p. Quadrant outfit, on which there was absolutely no sign of compression. After trying valves, I removed cylinder and found that both piston rings had seized in the slots. Apparently, the carbon had recently been cleaned off the piston top, but the rings had been left untouched, as is very often done, with the result that, although the machine had only done fifty miles on a mixture of three parts paraffin, the rings had seized owing to excessive carbon in the slots. On removing carbon from slots the machine ran perfectly. Although there was absolutely no compression, the machine would take top gear on the road, which I think is a tribute to the Quadrant.

J. V. WRAIGHT, R.N.A.S.

### SUMMARY OF CORRESPONDENCE.

Yank Denton, now riding a Douglas in the B.E.F., is willing to take up the challenge issued to "J.H." on August 10th by "H.F.M.," "L.M.P.," and "J.A.M.," one of whom claims to hold the world's record of 104 m.p.h. He will purchase a T.T. model direct from an agent, and guarantees to ride them to a standstill on a give-and-take road if they ride machines purchased in the same manner.

### Obtaining Petrol when Touring.

Sir,—The difficulties of obtaining petrol will prevent many motor cyclists from touring. Although they may have a few tins in stock, it is impossible to carry more than one tin on the carrier. I would suggest that the difficulty might be overcome if motor cyclists in different parts of the country could get into touch with one another through your advertisement columns. For example, I wish to go from Bristol to North Wales, and if some good, kind Samaritan in North Wales, who has intentions of touring and passing through Bristol, will promise me a tin of petrol, I will promise him a tin when he passes through Bristol. A.E.D.

### The Silver Paraffin Vaporiser.

Sir,—In reply to Mr. Silver's letter in *The Motor Cycle* of August 24th, allow me to state a few facts. In the first place, I have been connected with the motor trade since its commencement, and, moreover, I rode a Butler motor tricycle, the first motor ever introduced into this country, in the opening run to Brighton with a paraffin vaporiser fitted, and I ran all the way on paraffin, picking it up at cottages en route, as petrol was almost unprocurable on the road in the early days. The device is really a very old one used on ordinary stationary oil engines, with a cup underneath for warming-up purposes, and used extensively in the States. We started fitting the device commercially over two years ago. Re the last part of his letter about it being protected. If this was done in 1903 the patent would have expired. I have seen Mr. Silver's apparatus, and there are no protection numbers stamped on it such as the Patent Office requires. Perhaps Mr. Silver can tell us when and how it is protected, as really no novelty exists. In conclusion, I would point out that during the last six months we have had even a simpler device under test, where no petrol need be carried at all when once the engine has been run to start, and we hope shortly to put in on the market for a few shillings. A. DURANT.

OAKLEIGH MOTOR CO.

### Three or Four Wheels.

Sir,—Would it be possible for Mr. Scott to give a rough idea of the retail price of his invention? If it is no more than the price of a high-power sidecar outfit, I mean to go for one as soon as it is on the market. The difference in price between a sidecar outfit and a light car makes just all the difference to me, and probably to many others. Taxes, tyres, etc., are a further very real consideration.

Though I drive a 7 h.p. outfit, I am very far from being an expert. It would be a huge joy to me to have the shaft drive and detachable wheels, etc., as a relief from much dirt and anxiety. Altogether I am vastly interested in the new machine, and only wait to know something definite about the price before I put my present outfit up for sale. Mr. Scott's reply to Mr. Burnard is quite convincing so far as I am concerned. SUPER-AMATEUR.

Sir,—I have read with interest the correspondence in *The Motor Cycle* re the Scott Sociable, and wish to state my own opinion of it.

I have just purchased a motor cycle and sidecar, previously owning a car, and must admit I prefer the car for several reasons:

Firstly, the driver is more comfortable in a car.

Secondly, I think in wet weather the sidecar is miserable for the driver.

Therefore, if the Scott Sociable comes out at the same price as the motor cycle and sidecar, and you can easily get at nuts, which need frequent attention on a sidecar, it is a very fine combination. Even if it be expensive, personally I would prefer four wheels for the little extra cost.

P. G. WARNER.

Sir,—After reading Mr. Scott's reply to my criticisms of the Scott sociable in *The Motor Cycle* of August 17th, I feel inclined to remind him that abuse is no argument.

I have criticised his own offspring, and he is naturally indignant.

Mr. Scott has still to learn that in judging the appearance of anything the analytical mind is of no account. If

E20

one wishes to buy a hat and a shopman produces an ugly example, does one buy it on analysing its qualities as expounded by the shopman? Not I, anyhow! It is ugly; 'nuff said! I can get an excellent hat, and smart, for all that I have a fat head! (This is literally true.)

I am in full agreement with Mr. Scott that the sidecar combination is not attractive in appearance, but why in heaven's name produce a machine like the Scott Sociable, which, in my opinion, is far worse!

Mr. Scott says that my type of man is of minor importance; but there he is all at sea. I am his own very man. I am the sidecar man. Tried cars—can't afford 'em. Sidecars—wife doesn't like being all comfy and poor me out in the elements. I ride the humble motor bicycle now, and am just pining for a clever engineer like Mr. Scott to produce for me a nice, clean, comfy sociable—and then he produces a machine like that! It's horrible; I am a disappointed man.—I am in tears. S. L. BURNARD.

### Paraffin as a Fuel.

Sir,—In *The Motor Cycle* for August 24th I noticed in "Current Chat" you refer to bad running on paraffin under the heading of "Paraffin in the Cold."

May I, as one of the enthusiastic experimenters referred to, state my experience. For some time past I have been running my 1916 B.S.A. with coachbuilt sidecar on pure paraffin, starting up on petrol from an auxiliary tank. Just recently, owing to considerable tyre trouble, I was forced to undertake the run up from Somerset by night, starting before lighting up time, and arriving in London about 5 a.m. This run was accomplished on pure paraffin, and, moreover, the carburetter was loose, just being bound on with insulating tape. I had several longish stops, but after starting each time on petrol my engine ran perfectly on paraffin.

I am not writing this doubting in any way the correctness of your statement, but just to prove that it need not apply in every case.

The only alteration I have made is to put a conical shape piece of gauze in the induction pipe.

P. G. WHITTON.

[A number of interesting letters are unavoidably held over.—Ed.]

Sgt. Archie Roosevelt, son of the one and only Roosevelt, is in the 5th Regiment, U.S.A. Army. He is now at a business men's training camp at Plattsburg, where he is acting as despatch rider, using for the purpose a Powerplus Indian.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## The Delivery of Petrol.

**Q** Last June I paid for eight gallons of petrol, and as I had not got my machine with me at the time I left them to be called for, but, owing to being laid up with neuritis in the leg, have never had the chance, and now I have, with the rest of motor cyclists, been allotted six gallons for three months. Can I get possession of the four cans of petrol which were paid for so long ago from my dealer, and if the dealer cannot give me delivery have I a claim on him for money paid (22s.)?—R.L.

This distinctly interesting problem has not been at present, we believe, definitely decided in the courts. Upon the whole, we are inclined to think that you have not a good case for compelling the petrol dealer to deliver the eight gallons you ordered and paid for in June. Undoubtedly a contract was entered into, but your normal right to have delivery made as and when required is, we fear, prejudiced by a clause in the existing Finance Act, and also by an Order in Council issued recently. The Finance Act states: "A person shall not supply motor spirit to a person unless he is the holder of a licence for the time being in force under this section, or in excess of the amount authorised to be supplied by the licence"; whereas the Order in Council says, "If any person who is under a contract to supply motor spirit refrains on the request of the Board of Trade, or any person authorised for that purpose by the Board of Trade, from delivering motor spirit in accordance with his contract, that person shall not be liable to any action or proceedings taken against him in respect of the non-fulfilment of his contract so far as it is due to compliance with that request." It must be understood that we are not able to state authoritatively the legal position, but, assuming that the result of the two passages quoted is to render it impossible for you to secure delivery of the petrol, you undoubtedly can recover the money paid for the four cans.

## Gear for Sidecaring.

**Q** I at present ride a  $3\frac{1}{2}$  h.p. single, to which I recently attached a cane sidecar. It is a three-speed machine. For solo work I found it had a sufficient reserve of power, but for passenger work I have to change down rather frequently in a rather hilly district. (1.) What do you consider the lowest power I can use consistent with a confident ascent of hills? (2.) If the power you indicate necessitates a twin-cylinder machine, are twin-cylinders much more complicated than singles? (3.) Do you consider the present time an advantageous one for buying second-hand machines in view of the shortage of new machines? Are second-hand prices higher than they used to be? (4.) Am I right in assuming that there has been little improvement in design during the last two years owing to the war, and that a 1914 machine would be almost as up-to-date as a 1916 machine?—H.V.O.R.

(1.) Suitably geared, you should find a  $3\frac{1}{2}$  h.p. quite sufficient for almost any district with a light sidecar. Your top gear should not be higher than 5-1. (2.) A twin is, of course, to be preferred to a single for sidecar work. It is very little more complicated than a single. (3.) No; second-hand machines are fetching good prices now—in many instances higher than in pre-war days. (4.) Some machines have altered very little; others have greatly improved in detail.

## Local Taxation Licence.

**Q** Will you kindly inform me whether I am entitled or not to use my motor cycle without a local taxation licence? It is used solely for business purposes. The motor cycle is a  $3\frac{1}{2}$  h.p. New Hudson standard pattern. I do not use a sidecar. If there are any alterations needed, perhaps you will be able to tell me what to alter.—J.J.M.

You will not have to pay a local taxation licence if you use a sidecarrier properly constructed for the transportation of merchandise, and which has your name and address painted on the side. Your motor cycle alone is liable to the licence, as it is not constructed in such a way as to make it suitable for carrying goods.

## Piston Tap.

**Q** I have recently purchased a 1914  $3\frac{1}{2}$  h.p. single in splendid condition, but I cannot trace the cause of a metallic rattle or knock which is very noticeable when the engine is running at slow speeds. There is no up and down play in either the big or the little end. The two rings fitted at the top of the piston are a good fit all round, with little or no play whatever. I have reduced the jet, and get at least 90 m.p.g., and the engine does not get too hot. The knock or rattle starts after the engine has been running for about five minutes, and does not alter on any of the three gears, and yet if I open the gas the power is considerable, and will take me up almost any hill on top gear. Whether I ride the machine solo or with the sidecar the noise is just the same, but when climbing hills it almost disappears. I have checked the timing, adjusted the valves and tappets correctly, oiled carefully, removed all carbon deposit, and have done everything I can think of without the slightest result. The strange part of the whole affair is that after purchasing the machine I rode some forty miles to my home, and certainly never noticed any unusual noise until I had taken the engine down and removed a quantity of carbon from rings, piston, and cylinder head.—S.F.

Your trouble is undoubtedly a piston tap, due to the piston being a rather sloppy fit. Unless very pronounced it will be quite harmless, and may disappear when the piston and rings have attained a slightly carboned state, such as they were probably in when you first purchased the machine. If the sound is very noticeable it will probably mean a new piston, and possibly a new cylinder to stop it. Use a thick lubricating oil.

A COUNTRY GROCER'S SIDECARRIER.

A  $3\frac{1}{2}$  h.p. Rover outfit owned by Mr. F. Hunt, of West Wickham, Kent. The large capacity body will be noted.

**Two-stroke Overheats.**

**Q.** Will you kindly give me a few reasons why my  $2\frac{1}{2}$  h.p. two-stroke overheats in a journey of six miles—up very ordinary hills? I give it any amount of oil, so I do not think that can be the reason.

—D.G.

The usual cause of overheating is incorrect carburation. You most probably have too large a jet fitted. An engine will also overheat if not clean inside. You should make sure there is not excessive carbon deposit on the piston top, and that the rings are free in their grooves. You should give enough oil to cause the engine to be on the point of smoking without actually doing so.

**Magneto Timing.**

**Q.** I have a  $3\frac{1}{2}$  h.p. single, fitted with a Bosch magneto, which, when timed correctly, works splendidly, but within a month the magneto has slipped twice, causing it to spark too late. I find that travelling over rough ground caused the trouble—at least, I presume it was that, as the trouble started after going over a bad surface. Could you tell me how to time it myself, as it may land me miles from a garage? It is a 1914 model, and I think the magneto is in good condition, as I can get a splendid spark from it.—S.G.S.

The magneto should be timed in the following manner: Place the piston exactly on top of the compression stroke, and connect up the magneto with the points just about to break and the ignition lever two-thirds retarded. This will mean that the explosion when the ignition is fully retarded will take place when the piston has travelled about 1.5 mm. down the firing stroke. The magneto ought not to slip if the cone fitting of the sprocket is an accurate fit and the holding nut is screwed up sufficiently tightly.

**Popping in Carburettor.**

**Q.** I have a  $2\frac{1}{2}$  h.p. two-stroke which has been running very satisfactorily up till lately, when it has developed an annoying habit of blowing back through the carburettor. At the same time it takes very little air indeed, and if accelerated stops altogether. It is fitted with a Senspray (30 jet), and all the joints are free from air leaks. The petrol pipe is quite clear. The petrol consumption has hitherto been far greater than it should be for a machine of this power (about 70-80 m.p.g.). Would a warm air intake improve this?—J.W.

Your trouble is undoubtedly due to too weak a mixture, caused by a stopped-up jet or petrol pipe or an air leak either between the carburettor and engine or somewhere in the crank case. Make sure that joints such as oil unions, pipes, etc., are in perfect condition. Yes, a warm air intake would probably make an improvement in the consumption. To obtain the best consumption you should make sure all adjustments are quite correct—exhaust pipe free, and ignition sufficiently far advanced, and so on. Use as small a jet as possible consistent with satisfactory running.

**Four-stroking.**

**Q.** I have purchased a second-hand 1915  $2\frac{1}{2}$  h.p. two-stroke, two-speed motor cycle. The engine four-stroked and back-fires badly, and on taking cylinder down I find the piston has only one ring—the top one—the bottom one being missing. Does the missing ring account for the machine four-stroking and back-firing?—L.C.

We do not think the missing ring would cause the trouble, though it would undoubtedly be as well to have this replaced. The four-stroking is probably due to faulty carburation—possibly too large a jet. Also try a new plug of good manufacture with stout electrodes.

**READERS' REPLIES.****Heated Crank Case.**

I was worried in the same way as "C.G.J." by the crank case of my 1913 Triumph getting excessively hot. The remedy in my case was Price's A.—E. ORTON.

**Does Motor Cycling cause Neuritis?**

With reference to "R.L.'s" question, may I, with all deference, point out that the word "neuritis" is, by us medical people at least, used to express disease of nerves, most usually of an inflammatory nature? When we wish to describe joint troubles of a similar type, we use the term "arthritis." I am quite aware that many people use the term "neuritis" to express almost any pain in a limb, and often elsewhere. But, after all, we may as well be accurate in our use of technical terms. I may say, as an old motor cyclist, that I think the use of a motor cycle is far more likely to ward off than to produce either arthritis, neuritis, or fibrositis in an otherwise healthy rider, provided he has a well-built machine and a good saddle, and rides reasonably.—PHYSICIAN.

**Refusal to Fire after Overhaul.**

In your answers to "C.J.P." on August 17th you do not give one possible solution of trouble which has occurred to me, namely, not realising which cam in the magneto should fire which cylinder. On one occasion I rewired the high-tension leads from the magneto on my machine (6 h.p. twin Bradbury), leaving them of equal length, and, testing through with a test battery, joined the one worked off the rear cam to the back cylinder and the one off the front cam to the front cylinder. I then timed in the usual manner by the back cylinder, and found that the front cylinder was firing half-way up the compression stroke. Of

course, as the engine is not symmetrical, the cams are not symmetrically placed, and there is a short gap from the front cam to the back cam, and a long gap from the back cam to the front cam. Of course, also, the remedy was to cross the leads and time the back cylinder to the front one. This seems very obvious; but if one does not notice the number stamped on the cam and the magneto terminal it is quite an excusable mistake. —W. G. H. MILES, Capt. R.M.L.I.

**IMPORTANT NOTICE.****GOODS MADE IN GERMANY.**

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS.** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged, when under £10 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## MOTOR CYCLES FOR SALE.

TRIUMPH, 1911, free engine, adjustable pulley (new), Dunlop heavy and butt-end tube (new), running on Binks, lamps, horn, fast, sound condition; £25, ex change.—Frobisher, 413, Wellington St., Grimsby. [X6621]

1916 4 h.p. Triumph, 3-speed countershaft gear, been very little used, and in new condition, complete with Millers lamp set and mechanical horn, unsaturated; £63.—The Welbro Cycle and Motor Co., Saffron Walden, Essex. [X6553]

TRIUMPH, 3½ h.p., 1912, bought April 1913, clutch model, adjustable pulley, mileage under 4,000, splendid condition, written warranty given, large quantity spares, accessories, practically unused during war; immediate sale, nearest 27 gns.—Surveyor, 48, Balfour Rd., Ilford. [X6503]

## Velocette.

VELOCETTE, 2-stroke, 2-speed, chain drive, new 6 weeks ago, only done 550 miles, complete with head lamp, tail lamp, horn, etc.; £34/10, cost over £40.—Ellis, The Haven, Wivenhoe, Essex. [1180]

## Williamson.

WILLIAMSON, 8 h.p. (Douglas engine), sidcar, runs on paraffin; £52, near offer.—12, Myddleton Rd., Bowes Park. [1067]

## Wolf.

1914 Wolf, 2½ h.p., splendid condition, running order; bargain, £11.—Taylor, Gladwyn, City Rd., Chester. [X6611]

WOLF, late 1914, fitted with 4 h.p. J.A.P. engine and accessories, perfect order; £29.—Moss, Wem. [X6661]

WOLF, 4 h.p., 3-speed, all chain, new Easter, in splendid condition; £50.—Johnson, Middle St., Boleover, Derby. [X6604]

1916 Wolf, 2-stroke, 2-speed, hand clutch, kick starter, mechanical horn, 120 m.p.g. paraffin mixture; £33.—2, Wellington Park, Bristol. [X6455]

## Wooler.

WOOLER, 2½ h.p., 2-stroke; cannot take delivery from makers; sacred deposit; immediate delivery.—Fridham Cottage, Sudbury, near Harrow. [1037]

## Zenith.

PETROL Free with Zenith-Gradua 3½ h.p.; 19 gns.—Troward, 78, High St., Hampstead. [1189]

3½ h.p. Twin-cyl. Zenith, countershaft, free engine and kick-start model; price £45, guaranteed.—Wanchope's, 9, Shoe Lane, London. [1202]

1913 4 h.p. Zenith (semi T.T.), Sturmer-Archer 3-speed, splendid condition, Lucas lamp, etc.; £25.—Box 753, c/o The Motor Cycle. (D) [X6615]

## Ladies' Motor Cycles.

1916 New Lady's Calthorpe, 2-speed, clutch, 32 gns.; Hobart, 1913, 3-speed, clutch, 24 gns.—Troward, 78, High St., Hampstead. Phone: 5392. [1195]

LEVIS Lady's, 1915, Enfield 2-speed, speedometer, lamps, horn, and all accessories, good as new; £42.—A. A. Smith, 229, Broadway, Bexley Heath, Kent. Phone: 139. [1130]

## The Standardisation of Controls.

THE question of standardising the method of controlling a motor cycle is a subject we have dealt with on many occasions in the past. The desirability of uniformity of control is kept fresh in one's mind by the evidence occasionally given in connection with accidents. It was mainly with the object of reducing the possibility of accident that *The Motor Cycle* interested itself in this important subject. Leading articles focussing attention upon the matter appeared in our issues of April 2nd and October 8th, 1914, and we also took the opportunity of drawing the special attention of the Cycle and Motor Cycle Manufacturers' and Traders' Union, as well as the Auto Cycle Union, to the urgent necessity of manufacturers meeting and coming to a decision on the question of desirable standards of control. Following upon our issue of Oct. 8th, 1914, a letter appeared in our Correspondence columns from Mr. Basil H. Joy, secretary of the Institution of Automobile Engineers, expressing his agreement with our recommendation. He pointed out that the Engineering Standards Committee had at that time—October, 1914—a sub-committee at work on the subject of standardisation of controls of motor cars, and it appeared to him that the standardisation of controls of motor cycles would be a simpler matter than that of cars. Since that date nothing, so far as the motor cycling public is aware, has been done, for the very obvious reason that manufacturers are too much occupied in the production of munitions of war to give their attention to such topics. Though from enquiries we found that manufacturers generally took only a lukewarm interest in the subject, our efforts were accorded a certain amount of support which promised to develop.

The secretary of the Motor Cycle Manufacturers' Union brought the matter to the notice of his management committee. That body duly considered, and, indeed, had not disposed of the recommendation when meetings ceased in order to

enable the representatives to concentrate their whole efforts upon munitions. The secretary recently assured us that the matter was still on the tapis, though it certainly stood in the background till happier times, so that but for the war motor cyclists interested in the subject would now have known whether in the view of manufacturers it was possible to arrange that instead of some makers fitting (1) carburetter levers which opened outwards and others inwards, (2) the exhaust valve lifter or clutch on the left or right side of the handle-bar, (3) brakes operated by the left or right foot—all could be made to see eye to eye and settle upon a definite position for each particular fitting. The subject, simple as it appears on first thoughts, is in reality complex, and it will require very strong support from the riding public to cause manufacturers to change their patterns and possibly adopt somebody else's ideas.

During the last week or so a contemporary has revived this question, and has announced that the Society of Motor Manufacturers and Traders, Ltd., is about to make a definite move with regard to the standardisation of control of British machines. Obviously the reference to the S.M.M.T. is a mistake, as this body of car manufacturers would be no more likely to adopt any scheme applying to motor cycles than the representative body of motor cycle manufacturers would settle upon any important change applying to motor cars. No! When the time is ripe it will be for the Motor Cycle Manufacturers' Union to act, and, if that body concurs, the Engineering Standards Committee will be requested to consider and settle the details.

It will be gathered, therefore, that though the matter is in the background owing to the war, it has by no means been overlooked. Much as one may regret that all such important problems should remain in abeyance, seeing that with a comparatively small expenditure of time a unanimous decision might be reached, it is recognised that the whole skill of engineers should at this juncture be devoted to crushing the common enemy.

## Occasional Comments

By Ixion

### Overheated Sparking Plugs.

I want to press that little matter of sparking plugs overheating on four-stroke engines, which I mentioned the other week. I have a pair of brand new British plugs of decent make; two of my machines stick every time on two hills near my house when these plugs are in use; but make comfortable ascents every time with a pair of Hun plugs installed. Further, I can run one of the two machines to a standstill in a very few miles on the level with the British plugs in action; but it does not dry up on the enemy-made igniters. Are British makers aware of this contrast? If so, seeing that the Hun plugs are available for analysis, why don't they produce a cooler plug?

### Slow Speed on Top Gear.

One of my correspondents enquires how slowly the 1916 A.B.C. will run on top gear. I drove mine a mile to-day with the Watford speedometer at 9 m.p.h. on the fourth speed of  $4\frac{1}{2}$  to 1. Mr. Bradshaw would, however, be the first to dislike this point being treated as a criterion of the machine; and, as a matter of fact, no owner would drive it in this fashion, as the acceleration on such a high gear is bad. The design aims at attaining flexibility and acceleration by the combination of (a) easy gear changing, (b) immense r.p.m. possibilities, and (c) an unusual number of gear ratios. It is therefore senseless to drive slowly on the high ratios. For example, the engine balance is so good that there is no objection whatever to doing the slow work in traffic on second speed ( $9\frac{1}{2}$  to 1), and so retaining the power of a ferocious acceleration up to 45 m.p.h. in a very brief distance. Speaking offhand, I should say that I usually drop to second gear in heavy traffic, though the acceleration on third gear is good.

### Back to a One-lunger.

My readers may realise that for quite a long time I have been riding two-strokes and twins almost exclusively. The other day I went out again on a rigid-framed single-cylinder, and the experience was electrifying. My readers may have taken my enthusiasm for multi-cylinders (especially of the "flat" type) and for spring frames with a pinch of salt; but let any doubters repeat my own experiments. Confine your riding for a few months to spring frames, horizontal twins, and baby two-strokes. Then make a long trip over war roads on a powerful single of the highest class obtainable, and that with a rigid frame, and see how you like it. I will go so far as to say that, for fastidious riders, the rigid-framed single-cylinder is doomed; and I say that in full consideration of my many friends in the trade, whose past laurels are mostly achieved on the type of machine which I now decry. They will find that their keenest rivals are out to kill road vibration and engine vibration; and the firm which sticks over long to a type of machine that is the limit in respect of both forms of vibration will soon get left. So it is

really kindness that prompts me to make my language balance the strength of my feelings. The rigid-framed single of which I write belongs to a famous make, and probably very many riders up and down the country would give their eyes to get delivery of its latest model; but the difference between the two types in respect of the character of the locomotion they afford reminds me of the contrast between a growler on setts and a yacht cleaving a smooth sea with a steady breeze behind her.

### A Red Herring.

Many side issues will be dragged into this controversy before the trade and the public learn their inevitable lesson. For example, a well-known enthusiast chips me with a reminder that his favourite single has done fractionally better time over a flying mile at Brooklands than my pet twin can boast of. What of it? That machine A can do a mile in 40s. as against the  $40\frac{1}{5}$ s. of machine B is a matter of no interest except to racing men and advertising specialists. The main issue is simply stated. If it is possible to reduce road and engine vibration by only 25% by adopting a certain type of frame and a certain pattern of engine, the machines which effect this reduction will ultimately master our markets unless immense sacrifices in weight and cost are entailed. This last caveat need not be reckoned with. Machines of the newer design are already in existence which weigh less than several famous rigid-framed singles, and which cost no more than the average amount, or considerably less (say, 15% to 20% less) than the most expensive samples of the dominant type. The actual possibilities in the way of reducing vibration are probably much higher than 25%.

### A Thoughtless Designer.

In the days when I had a fad for accessories, correspondents used to sigh for a glimpse of what they were pleased to describe as my "pantehnicon," and draw fancy pictures of a kind of two-wheeled gipsy caravan with which I was humorously supposed to travel. They will smile when I confess that of late I have been carrying a pulley drawing tool strapped to my carrier. It was thuswise: I had only one motor bicycle—partly owing to a disappointment in delivery, partly owing to wartime economies. This motor bicycle—I suppose I must call it by that name—had an encased chain, which was known to break on occasions. Before I could uncover it for repairs, I had to take off the countershaft pulley. This pulley was, as all well-fitted pulleys should be, very tight on its key and taper. You could not use wedges to shift the pulley, because there was a second light sheet metal chain case behind the pulley, which naturally buckled when used as a fulcrum for levers or wedges. So, until another machine became available, there was nothing for it but to carry a pulley drawer. I only hope the responsible designer's munitions are more carefully planned.

## 300 Miles between Sunrise and Sunset

Sydney Jones

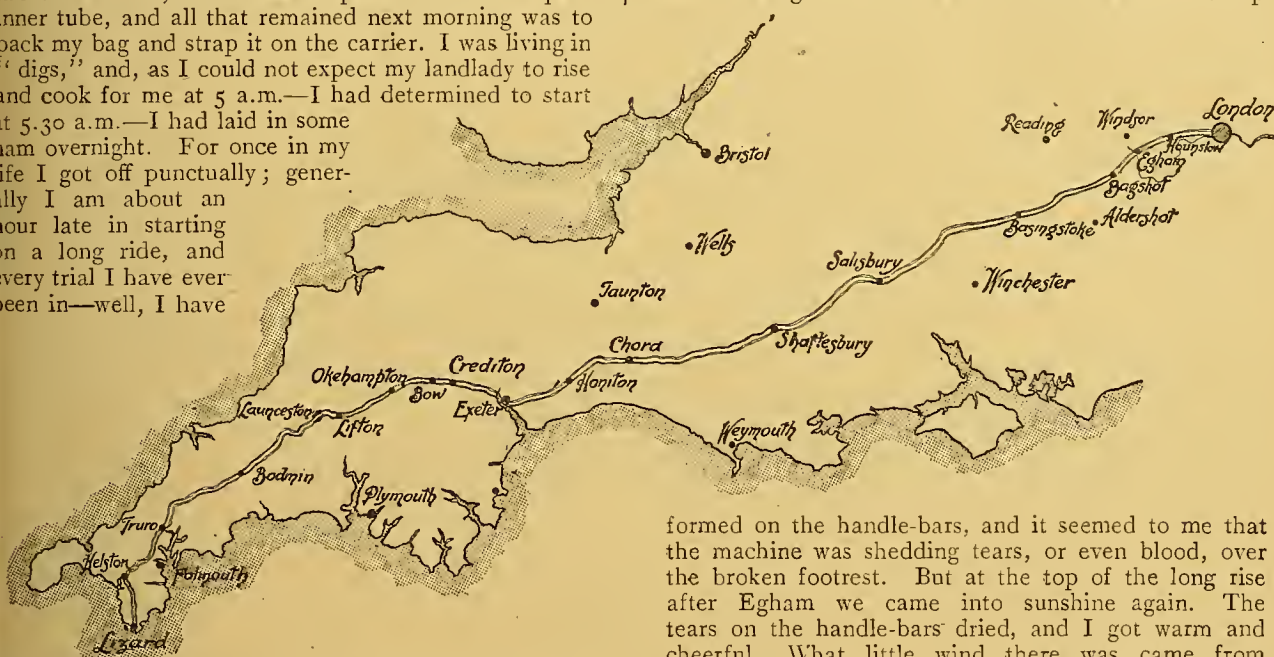

### PLEASANT MEMORIES OF A TRIP FROM LONDON TO THE LIZARD.

I WAS looking through an old diary the other day, and I came upon an account of this ride. It is just an ordinary account of a big ride—from London to the Lizard. There's nothing wonderful in it—either in regard to distance or adventures—but it is, excepting for trials, the longest ride I have ever done. The machine was a Douglas, 1914 two-speed  $3\frac{1}{2}$  h.p. T.T. model, and had only been two hundred miles before this ride. The time of the ride was July, 1914, just before the outbreak of war.

The bicycle was got ready the night before. The tanks were full, there was a spare belt and a spare inner tube, and all that remained next morning was to pack my bag and strap it on the carrier. I was living in "digs," and, as I could not expect my landlady to rise and cook for me at 5 a.m.—I had determined to start at 5.30 a.m.—I had laid in some ham overnight. For once in my life I got off punctually; generally I am about an hour late in starting on a long ride, and every trial I have ever been in—well, I have

coffee. Here a misfortune happened. My machine, which was on the slant at the side of the road, toppled over and smashed a footrest. Those footrests—they were the only fault I ever had to find with the Douglas. They cost me about £3 in repairs, and then I had footboards fitted—but more of that anon, for I had not yet finished with footrests for that day. The next half-hour passed sadly—who does not grieve over the first scratch or blemish on his new machine?

Through Staines and Egham I went, where low mist wreaths hung over the land, obscuring the sun, and making me chill and cold. Beads of damp

kept many a timekeeper and marshal busy cursing me at the start.

My way led through Hammersmith, Brentford, and Hounslow to the main Salisbury Road. Hardly a thing was stirring in London. At Hammersmith a few people were hurrying about, seemingly ashamed at being up so early—or perhaps so late! After passing Hammersmith I met a long line of market carts coming from the outskirts of London laden with fruit and vegetables for Covent Garden.

#### My Second and Third Breakfasts.

The air was cool and brisk, and, although I had breakfasted half an hour before, I was hungry again. At Kew Bridge I spied a coffee stall, and made an excellent second breakfast of hard-boiled eggs and

formed on the handle-bars, and it seemed to me that the machine was shedding tears, or even blood, over the broken footrest. But at the top of the long rise after Egham we came into sunshine again. The tears on the handle-bars dried, and I got warm and cheerful. What little wind there was came from behind, so that as I went along I seemed hardly to be moving, so placid was the air. Anyhow, I did move, for even after a rest and a smoke on Salisbury Plain—boiling hot even at that time in the morning—I arrived in Salisbury in time to make a third—and incidentally an excellent and substantial—breakfast in the County Hotel at 9 a.m. After a fill-up for the machine I left Salisbury at 10 a.m., and an uneventful ride brought me to Honiton in time for lunch at 12.30 p.m.

#### The One Involuntary Stop.

The smooth purr of the Douglas delighted me as I sped along. Here, just outside Salisbury, I passed a spot where I had once spent two hours with water in the magneto, and here at Shaftesbury was the hill where my old T.T. single speed had conked out after

## 300 Miles between Sunrise and Sunset.—

running all the way up from Penzance. Here was Chard, where a former mount had once caught fire, but had been put out without even getting charred (will this pass the censor?). Chard Hill was surmounted with ease—only the last fifty yards or so necessitating bottom gear. Yarcombe Hill was conquered on top gear, including the hairpin.

I felt glad indeed as I sped along and recounted all my old troubles on other mounts, and thought that they were gone for ever! At lunch time I began to feel the effects of the sun, and my face was red.

At lunch I met the rider of a baby Triumph proceeding to Exmouth, and we started off together. I set the pace, a pretty stiff one, on the fine main road to Exeter, but the little two-stroke purred along quite comfortably at my side at about 35 m.p.h., until my new friend branched off to the left for Exmouth.

The heat was excessive, and at one place I got tar squirted in my face. After this I bathed my face in a stream which made matters worse. My face hurt quite badly, and there seemed not a breath of wind.

Beyond Exeter, the detour through Crediton and Bow to Okehampton was taken to avoid the bad main road. Here I had to clean an oily plug—my only involuntary stop of the day. Tea was very welcome at that excellent little A.A. hostelry at Lifton, about four miles on the Exeter side of Launceston. I always try to stop there for a meal when going West, and advise others to do the same.

At tea I used most of the milk to bathe my face, and very little of it for its legitimate purpose. This, combined with the fact that the wind veered round to the west after tea, made matters more pleasant, but

still my face was black with sunburn when I arrived at my destination. Just before reaching Launceston, I caught fire—those footrests again! The front ones could only be reached by a man 6ft. tall, and the left back one was perilously near the exhaust pipe. My Hutchinsons had got on the pipe and smouldered, as had also my trousers. Fortunately my leg was not burnt, but trousers and Hutchinsons were about done for. It was after this had happened twice more that I had footboards fitted, and after that there was no more trouble. Nothing of interest arose during the rest of my journey. The twenty-two miles between Launceston and Bodmin were covered in threequarters of an hour—the moor looking beautiful in the evening light. A stop was made at Bodmin for petrol and oil—the first fill-up with oil since leaving London—and then a non-stop run right through to the Lizard followed. There was a fine view of the sinking sun just after climbing the steep hill out of Truro.

By the way, I think almost every town and village of any size in Cornwall is on the slope of a hill. I can count up twelve Cornish towns on hills of more or less severity—in the case of six the main street is a single-figure gradient. To follow the narrative once more, the road from Truro to Helston—a succession of long winding hills—was quickly traversed, and the Lizard was eventually reached just as things were assuming a queer shape in the dusk and in time to avoid using a lamp.

To sum up, the total distance was covered in 15½ hours, including 2½ hours for meals, etc. The petrol consumption averaged over 80 m.p.g.

The journey was a great contrast to other journeys I have made on a single-cylinder machine over the same country.

E.R.T.

## SHAPE OF PETROL PIPES.

RECENTLY a friend of the writer, the owner of a new twin-cylinder machine, has experienced a good deal of trouble due to water in the petrol—so he imagined. The trouble usually took place when on the way home after fall of darkness, and particularly after a day's hard riding, the first symptoms being a quick falling off of power, then sudden acceleration, till presently the engine would stop, the float chamber empty. After flooding the carburetter the machine would go ahead another half-mile, then stop again, and on reaching home the rider would carefully drain off the petrol, generally to find a few blobs of water at the bottom of the tank.

Removing the gauze did not remove the fault, which was repeated at least once a week in spite of various "remedies," till one day it dawned upon the bewildered experimentalist that the trouble occurred only when the tank was three parts empty.

The trouble was solely due to the shape of the petrol pipe, as a more experienced rider might have discovered earlier. When the tank was almost empty, air passed into the pipe and caused an air lock.

Fig. 1.

Fig. 2.

This particular pipe was shaped as in fig. 1, the bend B being at a slightly higher level than the bend A, so that any air drawn in with the petrol lodged at the point B and impeded the flow of the spirit.

One can fully conceive that a fault of this kind is not the sort a beginner would quickly locate, but it is by no means unusual for the coil of a petrol pipe to be wrongly arranged to an extent that hampers the running of a machine. Many new mounts the writer has straddled have shown symptoms that the carburetter is periodically starved during the first three or four miles of a run, these symptoms being a sudden slackening of the engine, succeeded by bursts of speed on opening the throttle, and general unsteady running. As a rule, a judicious rearrangement of the feed pipe remedies the trouble.

When it can be arranged, a long, straight petrol pipe tends to a steadier feed than a short curly one, but unless of ample length breakage is liable. But when the curls are necessary they should be arranged with a constant slop downwards, as shown in fig. 2.

H.M.B.

## OVERSEAS OPINIONS.

### A Further Selection of Letters from Readers scattered all over the World.

**B**EING the first issue of the month, we again give a selection of extracts from our correspondence from keen Overseas riders. In making the following selection we had the greatest difficulty in choosing extracts from many of the letters without repeating continually the old grumble, which appears almost without exception in every letter received from practically all of the Dominions, viz., that of exorbitant charges by agents and the difficulty of obtaining spares. In order to give what we hope will be a final airing to this grumble, we will quote a glaring instance of the difficulties and inconvenience our Overseas cousins have to endure in order to indulge in the sport, or, we should now say, that most economical means of travelling, the motor cycle.

Mr. A. M. Cross, of Jzeugloweni, Natal, required spares for his British machine. He applies to the Natal agents; they tell him they have none, but will try and obtain them from Johannesburg. Some weeks later they write and say, "as we have been unable to obtain them, shall we order from home?" They are instructed to do so. Four months later he is informed that the goods have been ordered, but have not arrived. He then writes himself direct to Messrs. —, the makers in England, who reply that they cannot supply direct, and refer him to their agents at Cape Town. These agents upon being approached state that they cannot supply, as they are only agents for the Cape provinces, and not Natal. As a last resource, he writes to a London firm of agents, from whom after considerable delay he receives some of the parts required. Mr. Cross also states that some of the Natal agents refuse to supply parts to riders unless their machines were purchased through them.

This example is quite typical of the complaints we receive almost daily. We rather fancy our correspondents do not realise that at present the conditions at home are in some respects as bad as abroad, and are not likely to improve until after the war. In many instances manufacturers have a difficulty in obtaining machines even for their own use, so busy are they on other more important war work. We fancy that if Overseas riders will only wait with patience until the British motor cycle industry can settle down again they will find their grievances rectified, and machines which will put the best American machine in the shade for rough work and durability will be obtainable in ample quantities at more reasonable prices.

#### Reasonable Prices.

Mr. J. B. VERSFIELD, Simonstown, S. Africa: "The prices of motor cycles in this part of the colony are very reasonable."

#### Heavy Riding.

Mr. F. K. McMASTER, Birriwa, New South Wales: "I now ride a three-speed 9 h.p. Indian with mag-dynamo. A 3½ h.p. machine would not be powerful enough for my work, as I am often obliged to ride over ploughed ground with half a bag of wheat on the carrier; and I also have to follow the sheep tracks up the mountain sides."

#### Larger Tyres.

Mr. C. VERTUE, Young, New South Wales: "I find that at least 26 x 2½ in. wheels should be fitted to any motor cycle for use on the roads out here, as with smaller sized tyres the rims get badly dented. My machine is fitted with screw-down needle valves in the tank instead of petrol taps. These, I find, eventually become loose and allow petrol to splash out. I have fitted a petrol tap and soldered up the opening where the needle valve was fitted."

#### Ground and Mudguard Clearance.

Mr. F. BECKMAN, Grafton, New South Wales: "To overcome the spare difficulty British firms should open depots of their own in place of having agents. If this were done I am sure the British machines would outclass the American altogether, but, while the American machine is the cheapest, it must get a share of the public patronage. Regarding ground clearance, 5½ to 6 in. is about correct. There should be 1½ in. clearance all round the mudguards. The mud on our roads chokes up the wheel, which necessitates a dismount every now and again to clear the wheel with a stick."

#### Desirability of Enclosed Chains.

Mr. G. L. ROSS, Capetown, S. Africa: "I ride a 6-8 h.p. Clyde-Jap, 1912 model, with sidecar. Once a year I go for a 300 or 400 mile tour with my wife and little son. We have never had a mechanical breakdown; our principal trouble has been negotiating sand and awkward bends. I fitted a chain case to my machine, and have not had the slightest trouble with it, neither have several A.J.S. riders of my acquaintance. It is a fitment I consider absolutely necessary, and am astonished at other manufacturers not coming into line. Machines of 4 h.p. are conspicuous by their absence on our roads as passenger machines. No motor cyclists of my acquaintance are insured, as the premium is in the neighbourhood of £7. I have ridden for three years, and if insured I should have spent over £20 with nothing to show for it. The solo rider is a rarity here."

#### Enfields in New Zealand.

Royal Enfields appear to have made some very staunch friends for themselves among motor cyclists in New Zealand. Mr. F. Townshend, of Leeston, Canterbury, New Zealand, who rides a 1915 6 h.p. combination, reports that his machine eats up the hills in a most glorious style. In a recent run out to Christchurch, fifty-five miles, the time taken was 2h. 40m., out of which has to be deducted certain voluntary stops on the various hill summits for admiring the magnificent scenery. What these figures really mean, however, will be better understood by mentioning that the first hill rises 1,700 feet in a distance of four miles, after which comes a series of five of between 400 and 800 feet high, of which "the grades and bends are terrible." What appears to please this motor cyclist most are the excellence of the mudguarding, and the splendid suitability of the spring forks for the road conditions of that colony.

## Overseas Opinions.—

## High Prices.

MR. W. C. MORETON, Walcha, New South Wales: "I am in thorough sympathy with those Australian readers of your useful and interesting paper who indulged in a hearty growl at the way we motor cyclists are put upon by the high prices asked for English machines in this part of the world. I am a loyal Britisher, and shall go for the British machine every time, but it makes one think when £97 10s. is asked for an English machine, while an equally or more powerful American machine can be bought for £80, and the duty on American machines out here is 5% higher than on British goods."

## African Riding Conditions.

MR. A. HOPKIRK, Cape Town, South Africa: "For town riding the standard machines are good enough, save that the mudguarding should be more efficient, and there should be more clearance between the cover and the mudguard to allow for buckled rims and patched covers. The motor cycle for country riding is a different proposition altogether. In the first case it is absolutely essential that the bicycle should have a cradle frame, with large saddle, low riding position, with at least eight inches of clearance from footboards and crank case to the ground, with plenty of clearance between mudguards and wheels to allow for buckled rims and patched covers, with magneto and carburettor as high up on the machine as possible for running through rivers, with chain drive for sandy gulches with steep banks, and a two-gallon tank for petrol, for in most country districts petrol is hard

to get, and then most of the storekeepers will only sell four-gallon cans, and with a two-gallon spare tin on the pillion stand one can fill up from this tin instead of leaving half behind. It is a noteworthy fact that the record time for the Johannesburg to Durban trial (18½ h.) and Johannesburg to Cape Town (6d. 1h. 36m.) is held by Percy Hunt on a spring frame machine from the land of Notes, and when Percy Hunt and Morley finished the 1,000 mile record run they were quite active, while after a 400 mile trial through the Karroo on a rigid frame machine one gets quite exhausted by the constant shocks from the rocks and watercourses which strew the path."

## Durability of British Machines.

MR. FRANK CLARKE, Newcastle, New South Wales: "I am writing on behalf of my two friends. We three own 6 h.p. machines, fitted with J.A.P. engines. One of my friends has a three-speed Sturmey-Archer (countershaft) gear, while the other is a fixed engine model, and my own a standard Zenith. My friends' machines were built in Sydney, of Chater-Lea fittings, and have given satisfaction. Newcastle is connected to Sydney by rail, so we do not have much difficulty in obtaining spare parts, etc.; there are also motor cycle depots in town here. Most riders here choose heavyweight machines of 6 to 8 h.p., because of their durability and stamina. American machines seem on the increase, and compare favourably with English machines as far as running when new, but do not wear half as well as the English. My Zenith, which has completed 8,000 miles by speedometer, does not show any signs of wear yet."

## A New Zealand Motor Cyclist's Experiences.

WE recently had a visit from a young Overseas motor cyclist, Mr. A. B. Thomas, of Henderson, New Zealand, who wrote to us some months ago on the difficulty of obtaining spare parts for British-made machines abroad. We printed his letter, and on the occasion of his visit had quite an interesting conversation with him. He has joined the New Zealand Engineers as a despatch rider, but up to the time of calling on us had not received his machine, which, of course, will either be a Triumph or a Douglas. In his part of N.Z., he told us, the roads were very bad, there being only about two miles of good road in the cities. However, there will be some improvement shortly, since trams will be brought farther out and the roads will consequently be properly made. In the country very little has been done as regards road making.

Mr. Thomas is very indignant about the difficulty of obtaining spare parts. There seems to be an extraordinary shortage of cylinders, for example, and the price one has to pay for the parts is enormous. The usual procedure is to hear that the spare part is not in stock, and then the motor cyclist is charged a high price for having the part specially made. Mr. Thomas was also very strong on the prices of British machines in New Zealand. One costing £60 in England is sold in New Zealand at a cost of between £90 and £95. It has recently been pointed out to us by a trader from the Overseas Dominions that one of the reasons for these high prices is that the purchasers, being often domiciled far from the towns, needed a great deal more attention than the motor cyclist at home. The prices, he told us, included looking after it in a very thorough manner, and, in the case of a breakdown, on receiving a message the dealer would immediately go out, and, if necessary, spend the whole morning tuning the machine up. Mr. Thomas, however, informs us that instances of this nature are very rare. He thought that there would be an enormous increase in the motor cycle trade in New Zealand, and that in a few years more

machines would be sold in that country than at home. He thought there would be every chance of a dealer making a fortune who sold machines at a reasonable price, and he said that dealers, instead of encouraging the trade, were killing it.

Asked about the price of petrol, he said that in normal times it was 2s. to 2s. 4d. a gallon, but when he left a

A SOUTH AFRICAN CULVERT BRIDGE.

The one shown is about forty miles from Cape Town, and was erected by the R.A.C. of South Africa. The lady shown with the Douglas is the sister of Miss L. Hopkirk, a keen Cape Town motor cyclist, a very interesting letter from whom appeared in our Overseas Section of July 6th. Miss L. Hopkirk has covered nearly 10,000 miles in less than three years, and her sister often goes on the carrier.

few months ago it was selling at 2s. 8d., but there was no difficulty about getting it. As to the type of machine wanted in New Zealand, Mr. Thomas told us that he, personally, favoured a spring frame horizontal twin of from 2½ h.p. to 3½ h.p. He was most enthusiastic as to the superiority of the twin as against the single, owing to the smoother running.

# Spring Carriers.

## How to Improve Luggage Carrying Capacity.

THE ordinary motor cycle carrier leaves much to be desired as a mounting place for luggage, and now that it is often necessary to carry a petrol tin in addition to one's ordinary luggage the spring frame scores immensely in that it affords a sprung position for the load. There are many articles which cannot very well be mounted on a rigid carrier, as, for instance, a camera or a doctor's equipment, as the terrific jolting would speedily ruin such delicate articles. The next best thing to a spring frame then is a spring carrier.

Plan view of saddle carrier.

Saddle attachment of pillion seat carrier.

The accompanying illustrations show three types of spring carrier, which have their individual uses, and with which the writer has experimented. Any one of them can be made at a village cycle shop. The first is perhaps the simplest, and is particularly useful for carrying small and delicate loads, as it is sprung with the rider. Two strips of  $\frac{3}{4}$  in.  $\times$   $\frac{1}{2}$  in. flat iron are shaped to fit under the saddle, and holes are punched so that they can be secured by the nuts holding down the saddle body. These strips are first fixed

Attachment of back springs for pillion seat carrier.

in position, and the thin wooden platform is then laid on them and marked for the screw holes.

The second is a carrier most suitable for mounting a pillion passenger. The front of the carrier is secured to the saddle, so that it derives the benefit of the saddle springing, while the back is

insulated from the frame by means of cycle saddle springs.

The third form of carrier is well sprung and of useful dimensions. In this case, the front is fixed as follows: Screwed

Hinge for double purpose carrier.

to a stiff steel strip running across the rigid carrier is an oblong block of oak, at the top of which is fixed a hinge, one flange of the latter being screwed to the oak block while the other is screwed to the underside of the carrier platform.

Pillion carrier, front end of which is attached to saddle.

The rear portion is supported on springs, the strength and number of these being varied with one's requirements.

We have here three types of carrier: The first for carrying a light packet, such as a doctor's bag; the second for mount-

Rear-sprung carrier

ing a passenger (the front end, which, in this case, carries most weight, being sprung with the rider, this being necessary for good balance); the third is a carrier which, though not so well adapted to passenger work, is the best for those who wish to carry a petrol tin in addition to a well-sprung load.

Another great advantage of these spring carriers is that the articles mounted on them will keep in place without being fettered like Persian slaves. Personally, I think that, in rigid frame motor cycles, the luggage carriers, to be of any real use, should be sprung, preferably with the rider. Is not this a problem for the saddle manufacturers to tackle?

H.M.B.

## A LAMP "TELL-TALE."

HOW often one wonders during a night ride whether one's back light is alight, and to ascertain by turning one's head is generally asking for a bad spill. A simple fitment that can be carried out by anyone is explained in the sketch, which shows a short piece of tubing soldered on to the back of an acetylene back lamp, so that a round spot of light is thrown on the road just in front and a little to one side of the

A simple rear light "tell-tale."

rider's right foot. It is then an easy matter to tell exactly how your back lamp is behaving.

To make a really good job of it, it is best to take a piece of tube and fit a glass to it in the following fashion. After having cut the glass to fit the outside circumference of the tube, lightly cement the inner portion where it fits, and then leave to dry—this, of course, after you have soldered the tube to the lamp itself. Two thin wires then crossed over the face and twisted tight make a secure holding with a spot of solder on the twist to finish it off. Many tail car lamps from the early paraffin days have been fitted with a device somewhat similar to the foregoing.

## Heavy Sidecar Machines as Solo Mounts.

Is the Combination Machine Useless without its Sidecar ?

**A**N article appeared in our issue of June 1st describing and illustrating one of the latest War Office Clyno officers' sidecar outfits, which had then covered some 800 miles test in our hands. Since then we have had the pleasure of continuing the test, which eventually totalled over 2,000 miles; a certain distance of which was covered without the sidecar. As a sidecar our experience on the road during various journeys, amounting to over 1,000 miles, and including the Birmingham Munition Workers' Trial at Easter, was that the machine behaved in a most exemplary manner, and during that distance required no adjustment whatever, except that the petrol feed pipe broke after about 800 miles. As for hills, we have not found an ordinary hill during our trips, which included some of the hilly district in the neighbourhood of the Thames valley in Bucks., for which the low gear was required, in spite of the fact that on several occasions three passengers were carried; while on one run from High Wycombe to Bourne End, taking the rough steep road over the hills from Loudwater, four passengers were carried, yet the Clyno ran merrily over on second without a suggestion of a knock, in spite of its previous 1,000 miles without overhaul or adjustment.

### Solo Riding.

Many people imagine that these machines, being built as permanent sidecar outfits, are quite unsuitable used as solo mounts. However, one day, requiring a fast solo mount, we decided to try the Clyno without the heavy sidecar just to see how it would figure, and incidentally save petrol, so valuable at the present time. Although the sidecar is attached by no fewer than six substantial connections, which gave the impression that the work of detaching would be a somewhat tedious operation, we were pleasantly surprised to find that ten minutes was ample. A substantial kit bag containing a complete change of clothes was strapped on the carrier, and a start was made at 3 p.m. one sunny afternoon for Cardiff. The first hundred yards or so felt somewhat strange, as we had not been astride a really heavy mount for some little time. However, once on the open, but bumpy Birming-

ham Road, the full pleasure of a powerful twin ridden solo came to us, and was enjoyed more fully owing to the fact that a baby two-stroke had formed our usual mount for some time. The eighteen miles to Birmingham, or rather King's Heath, were covered in excellent time, and even the atrocious roads near Meriden, which on previous journeys on the small machine had caused great discomfort, appeared on the heavy mount to be almost smooth, in spite of the fact that the spring forks had been designed for heavy sidecar work, and so were none too resilient.

### A Good Test.

A non-stop run to Worcester ensued, during which we indulged in good turns of speed. Tea was taken here and the journey resumed *via* Malvern, Ross, Monmouth, Usk, and Newport, Cardiff being reached just before lighting-up time after a most enjoyable ride. Next day broke fair, and the morning was spent on short rides through the city, where the easy starting and controllability of the Clyno entirely obviated any discomfort which might have been noticed due to the weight. In the afternoon a start was made for Swansea, but shortly after leaving Cardiff rain commenced to fall, which ultimately turned into one of the heaviest downpours we have had the misfortune to be out in for a very long time.

The long stretch of badly-laid tramlines into Swansea was negotiated without the least discomfort, apart from the unpleasantness of the rain, which was so heavy that at one point the road was flooded to a depth of about a foot, but none of these conditions caused a skid or a misfire. Next day, after repairing a tyre, which had deflated during the night, the accessibility of which was greatly simplified by the detachable wheel, a start for the Midlands commenced at noon. The route selected was *via* Brecon, Hereford, Ledbury, Malvern, Upton, Evesham, etc. Upon arrival at Coventry, after an absolutely uneventful ride during which nothing was touched except the tyre, we were firmly convinced that this type of machine, in spite of the many opinions to the contrary, formed an eminently comfortable and controllable solo mount.

ITALIAN MILITARY SIDECARS.

A fleet of sidecars used for the rapid movement of small numbers of troops from one spot to another. Each machine carries three men

## MILITARY NOTES.

### Despatch Carrying in the Jungle. Road Conditions in the War Zones.

#### ACCESSORY MAN IN THE A.S.C., M.T.

J. F. SPENCER, of the Priory Motor Accessories Co., Coventry, joined the M.T., A.S.C., some few months ago. He is now in France attached to an ammunition park serving Australian troops. Though attached to a workshop section, Spencer is detailed to drive a 4 h.p. Douglas sidecar, so that he gets some runs occasionally. During recent hot weather in France bathing in the canal, about four miles from the camp, has been greatly appreciated.

#### DESPATCH RIDER MEETS A LION.

IN addition to trying road conditions in German East Africa, motor cycle despatch riders attached to General Smuts's forces run the risk of meeting wild beasts. For instance, the following is extracted from a recent message from a Press Association correspondent writing from Kondo-Itangi:

"These despatch riders have performed wonders of endurance, and won through hardships that cannot be put down on paper. Singly they go off for a fifty or 100 miles ride through desolate country, infested with wild beasts. And should they be out when night falls, then all there is to do is to shin up a tree."

"One man had almost a tragic experience. He was riding along very fast in the semi-darkness when suddenly he saw a lion across the road. He managed to swerve a little, but grazed the lion's hindquarters and struck his tail. He then ran 'smack' into a stone, was thrown from his mount, and strained his ankle. The lion had not made off, but had turned round to see what manner of beast it was that had hit it. While it hesitated the despatch rider got up a tree. There had been no time to unship the rifle. The man stayed on his risky perch

all night, without a bite of food or any covering, soaked to the skin by the tropical rain that fell. When morning came the lion had gone, but the road was like a miniature lake, so that riding was out of the question. But the despatch had to be delivered, so on he limped as best he could, every step a pang of pain. A little way along the road he struck a wireless camp, where he found the two men he was seeking.

"Another despatch rider was charged by a rhino, which, luckily, stopped short on account of the unearthly yells of a couple of troopers, who were witnesses of the encounter."

#### WHERE ARE THE WORST "ROADS"?

SINCE the early days of the war readers have been made familiar, through the medium of our "Military Notes," with the difficulties encountered by despatch riders in the various war zones. More recently, or within the past nine months or so, we have been able to appreciate to some extent the appalling "road" conditions prevailing in Macedonia, Mesopotamia, and German East Africa, and in reading the experiences of military motor cyclists in these parts of the world one wonders in which country motor cyclists are operating under the worst conditions.

#### A TWO-STRETCHER SIDECAR AMBULANCE.

This business-like looking outfit has been standardised by the Hendee Mfg. Co. after careful testing. Regulation stretchers are used, and they are fitted with special pedestals which fit into sections of the carrier frame, where they are clamped down to prevent sliding or slipping from position. The chassis is specially constructed for the work while the bicycle is a Powerplus Indian.

#### MOTOR CYCLE RECRUITS FROM THE INFANTRY.

The R.F.C. need so many motor cyclists that infantrymen having some knowledge of motor cycles are being transferred. Our picture shows an infantryman starting for a trial run on a R.F.C. P. and M.

Judging by the extracts of letters published, we should say that there is very little to choose between Mesopotamia and German East Africa. In both the countries named motor cyclists have had to contend with a trying, and at times unhealthy, climate, coupled with an entire lack of roads. In German East Africa many riders, according to more than one report, have also had encounters with wild animals, whilst difficulties in the jungle are fairly common. Without actually going to both countries one cannot accurately compare the prevailing conditions; the point is that in all the war zones the combination of hardy, keen riders and good motor cycles are accomplishing work that before the war would have been described as absolutely impossible. Despatch riders and their machines have been buffeted about in France a great deal more than in all the Six Days Trials combined, but, as we have said, the conditions in the war zones further afield are still worse.

#### MOTOR CYCLIST AIRMEN.

WE have often referred to the number of motor cyclists who have joined the Royal Flying Corps, their performances proving what a good training motor cycling is. No better proof could be produced in favour of this contention than the fact that Lt. George McCubbin, D.S.O., the young aviator who brought down the famous Immelman a few weeks ago is a keen motor cyclist. A little less than two years ago, according to the *South African Motorist*, Lt. McCubbin was riding a Triumph in Durban.

## THE HOSPITAL SHIP.

### A BURST TYRE.

**S**HORT is the blissful hour that comes before the sunrise: yet when life is as full of incident as he found it by Cape Helles an hour may be an eternity. There is a limit for tired nerves, worn out with sudden alarms and more sudden death on all sides, and it is in that hour full of shadowy mists that all men's souls sail from the peninsula on the wonderful hospital ship that carries them home and back in an hour, leaving them at the dawn with memories to fight for, and courage to see them through.

He lay in a cramped position at the entrance to the best dug-out on the peninsula; beside any such work in Flanders it would have appeared rather like a bunker on suburban links. Beside him was a new tunic which in the most natural manner he had removed from all that was left of one of his friends the previous night. Its chief merit lay in its low population.

The hospital ship had deposited him on the Portsmouth Road with his Zenith, and looking over his shoulder he was pleased but not surprised to find that "she" was there too. Hospital ships are very thoughtful. As he turned round towards Weybridge he felt her hand drawing the cigarettes from his pocket, and a minute later a lighted Virginian was pushed between his lips. He raised his right hand in thanks. "Mustn't let her all out," he shouted over his shoulder, "that tyre on the front wheel's got a very weak spot; it'll go sooner or later."

Yet when he got close to the station he found that a short "blind" before the hill could not be avoided. "Shall I?" he shouted, and a tightened grip was enough answer.

They were just picking up well when the tyre went; in a fraction of a second he realised that he had no control over the machine, and fixed the very spot amongst the heather at the side where they should pitch. Yet they seemed to be minutes reaching it. He felt

as though he had just stopped everything for a little, while he examined the spot, looking into each yellow flower and noticing every drop of dew. The noise of the burst had been appalling: and yet he seemed quite used to it; vaguely he remembered having heard it once at quite frequent intervals, some-

where out of England, when—ah! yes . . . he raised himself on a stiff elbow, almost drenched in the dew. Well, anyhow, the first hour's sun would dry that thoroughly; it didn't take long in such a climate. . . . But where was the 'bus?

Oh! of course, he had been dreaming. But how vivid it had been.

"What was that, Spee by?" he shouted. "H.E.," growled a voice behind him. "Double L," he added with

"They were just picking up well when the tyre went."

a laugh, curling himself up again.

### ON BROOKLANDS.

It seemed as though he had been driving for hours, every nerve in his body seemed tense: every muscle strained. He knew there was something at stake; something big: and somehow he felt he was winning, there was a wonderful rush of wind in his face, yet his eyes were quite unaffected: he couldn't be wearing a

helmet, since he felt his hair waved back in the breeze, and his head was cool; he felt somehow as though he had just had a glorious shampoo. That made him laugh. He couldn't somehow stop laughing . . . it seemed so jolly fine to be winning so easily: there was nothing ahead of him on the track! he was simply unbeatable. What if he stopped and lit a cigarette and then went on? He shrieked with laughter at the idea. What a jest it would be!

Somewhere behind him there came a little purring that grew a bit insistent. His confidence seemed to leave him suddenly: both machines were roaring now, but what a splendid cackle! His hands got hot and sticky, and he felt his grip on the bars loosening.

"It seemed as though he had been driving for hours, every nerve in his body seemed tense: every muscle strained."

**The Hospital Ship.—**

Perspiration began to pour from him: then a shadow started crawling up behind him. He could see the machine out of the corner of his eye: it was certainly gaining. With a roar that startled him it overtook and passed him. Well, it was hardly worth while going on, now. He seemed to be drifting just anywhere. Two or three machines passed him. Then suddenly a very small voice right in his ear distinctly said, "Who ran that belt through?"

With a long sigh he rubbed his eyes and sat up.

"Who a . . . what . . . ?"

"Who ran that belt through?"

"Who did *what*?"

"Oh, do wake up, you chump: didn't you hear a machine gun?"

"No . . . well, yes: I suppose I must have: I seem to remember it."

**ON THE PORTSMOUTH ROAD.**

He was leaning on his Zenith just where the road turns at the entrance to Ripley, explaining very carefully to someone that that house over there was the twelve-pound house; referring to the newly painted golden medallions on the great iron gates. He

seemed to be surrounded by every motorist he had ever known; he recognised every machine, and every detail on it: dirty knee-grips here; enormous exhausts there; he caught sight of a Brough, and waved his hand and shouted, "Hullo! Ken."

"Harry's comin' along on somethin' rather sweet, isn't he?" said someone; and they all stopped talking and listened to the perfectly running engine. . .

He stretched lazily and opened his eyes. Ever so far above him the blue sky reached out to infinity.

Straight overhead an aeroplane passed on an early morning reconnaissance. How clearly he saw it, he could even distinguish the exhaust. . . that engine sounded pretty healthy. With a puzzled look in his eyes he repeated to himself very softly: "Harry's comin' along on somethin' rather sweet, isn't he?" Who could have said that just now? Good lor', he must have been dreaming.

He roused himself and scrambled to his feet. Crossing over he kicked Speeby affectionately: "Come and help with the breakfast," he said.

"Comin', sir," said Speeby, sitting up.

He burst into a shriek of laughter at the "Sir." A slow smile dawned over Speeby's face. "I dreamt I was on a ship," he explained.

## Electric Ignition for Acetylene Lamps.

### A Method of Lighting an Acetylene Lamp from the Saddle.

ONE of the inconveniences of acetylene lamps is that they are very troublesome to light. Nothing is more disagreeable when returning from an excursion at the fall of night, and travelling quickly so as to arrive in time for supper, than to be obliged to get down from the machine in order to light the lamp. In bad weather, lighting the lamp is so tiresome that often the motor cyclist prefers to ride in the semi-darkness and risk an accident so as to get home more quickly and without a stop.

To remedy this inconvenience I have combined a very simple little arrangement which at the desired moment causes a spark from the plug of the engine to pass above the acetylene burner. The operation is performed without descending from the machine and without stopping, and I have never had the least trouble with it nor been obliged to use matches. At lighting-up time I turn the water tap of the generator, and while continuing to ride, I wait until the gas comes out of the burner. That is easily ascertained from the odour. At this moment I take hold of an insulating holder attached to a supple wire and touch the sparking plug of the engine. The spark passes above the gas burner, and the gas lights. There is a misfire at the engine, but that is not important. Don't wait too long or you *might* burst the lamp.

**Construction of the Device.**

A piece of insulating material, wood or fibre A, is fixed under the burner carrier between the fixing screw B and the wall C of the lamp. This piece serves as a

support to a thin blade of metal, which is curved in such a way that its thin end comes over the burner at the edge of the gas aperture and facing another blade of metal fixed to the metallic part of the burner by a collar or a metallic wire. The two blades must have their extremities as near as possible to each other, but not so near as to prevent the formation of the fan-shaped flame. It is between these two blades that the spark will occur. Care must be taken thoroughly to insulate the metal fixed to the insulating piece. The wire attached to this blade can be a flexible wire, but well insulated. It will come out of the lamp by means of any air orifice, and will be attached to a kind of insulating handle terminated by a metallic button.

Dr. Camus's method of lighting an acetylene lamp.

**Alternative Methods.**

In the ordinary way this handle would be placed within reach of the motor cyclist in such a way as to enable him to take hold of it at the

moment of lighting to place the button against the plug.

In case the plug is difficult of access, a wire could be led from it to some convenient point of the frame within reach of the hand, where another metallic button could be fixed, well insulated, against which one could press the button of the handle to produce a spark.

It is also possible and easy to replace the holder and the insulating button by a switch, of which one pole is attached to the plug and the other to the lighter, but in this case care must be taken to use a switch well insulated, the poles of which are sufficiently separated to prevent the sparking from the plug passing over them.

(Dr.) R. CAMUS.

## SPECIAL FEATURES

HEAVY SIDECAR MACHINES AS SOLO MOUNTS.  
THE STANDARDISATION OF CONTROLS. OVERSEAS OPINIONS.

## TIME TO LIGHT LAMPS

"SUMMER" TIME.

Sept. 7th	...	...	8.3 p.m.
" 9th	...	...	7.58 "
" 11th	...	...	7.54 "
" 13th	...	...	7.50 "

## Pure Petrol Very Rare.

Complaints are increasing in number that most of the petrol one buys nowadays is adulterated—usually with paraffin. If such is the case it is scandalous in view of the price charged.

## Petrol Substitutes Popular.

Motor cyclists are settling down to petrol substitutes, of which there are about a score of brands. We have questioned many motor cyclists, and rarely find any using neat petrol. Heavy fuel is much more satisfactory with an air-cooled engine than with one of the water-cooled type.

## Duplicate Tanks.

Users of machines such as the old two-speed  $3\frac{1}{2}$  h.p. Humber and the spring frame Edmund having duplicate tanks find the latter of the greatest possible convenience. One compartment is filled with petrol for starting purposes, the other with the substitute favoured.

## Paraffin in the Heavy Section.

Motor cyclists of the Heavy Section of the Machine Gun Corps, who have their own machines in camp, are trying to run them on practically pure paraffin. The two-strokes go very well, we are told, though they do not two-stroke so regularly as with petrol.

## Obtaining Petrol Substitutes.

Readers about to purchase petrol substitutes are advised to take advantage of *The Motor Cycle Deposit System*, the operation of which is described on the first page of the Miscellaneous Advertisements. This suggestion is made in view of some complaints received of non-delivery of goods after payment has been made.

## Motor Cycle v. Ostrich.

An officer with General Smuts's force writes of his experiences from Kondoa Irangi. After describing how an apparently pro-German rhinoceros had overturned one of the armoured cars, he tells the following story of a race with an ostrich: "When riding a motor cycle one day an ostrich took it into its tiny head to keep pace with me. I opened my machine out full, but the ostrich, had no difficulty in keeping up, and if it had liked I am sure it could have beaten me hands down."

## Routes to the Scottish Capital.

Of the three roads from Newcastle to Edinburgh, the R.A.C. at present recommends that *via* Wooler and Coldstream, as the road *via* Carter Bar is still in bad condition. The military embargo has, however, been removed from the Newcastle-Berwick-Edinburgh road north of Berwick.

## Carry Your Exemption Certificates.

Motor cyclists engaged upon Government work or work of national importance, and who have received exemption certificates, would be well advised to carry them. The authorities are now holding up at different towns men of military age whether they are wearing official badges or not. A troublesome two or three hours' delay may be avoided if one is armed with an exemption certificate. At seaside resorts the special constables and military authorities seem to be enjoying holding up men and depriving them of two or three hours' sunshine while waiting in the police station for the examination of any papers they may have. At Llandudno ten days ago nearly 300 men were rounded up, much to the disgust of men wearing badges, and the sum total of all these efforts was the identification of two absentees!

## British Motor Cycles for Rumania.

A batch of over 300 Douglasses are now *en route* to the Rumanian Government, the makers having received permission to ship them a few days before the entrance of Rumania on the side of the Entente was announced.

## The Petrol Committee.

A veterinary surgeon in West Norfolk, anxious to economise in petrol, laid up his car and bought a lightweight O.K. Although he filled in the necessary form in good time and promptly sent it to 19, Berkeley Street, he was, a week ago, without his due allowance. Our correspondence pages show that this is no exceptional case. Other users on important work cannot obtain more than the half-gallon per week.

## Missing Machine Recovered.

The Manchester Motor Cycle Hire Co. inform us that as a result of the paragraph in our last issue the Enfield two-stroke reported as missing from their premises has been recovered. The person who is alleged to have stolen the machine sold it to a London dealer, who in turn sold it to a customer. The latter handed the machine over to the police immediately he saw the announcement in our last issue.

## MOTOR CYCLISTS OF MILITARY AGE! CARRY YOUR EXEMPTION CARDS!

Birmingham military authorities, in conjunction with the police, are displaying great activity in rounding up men who should be in the army, and last Sunday many motor cyclists, among others, were stopped to show cause why they were not in khaki.

### The National Relief Funds.

At the week-end the principal war funds stood as follow:

Price of Wales's National Relief Fund (£3,443,250 distributed)	£5,946,363	0	0
British Red Cross Fund .. ..	4,308,107	1	2
Tobacco Fund .. ..	113,182	10	8
Kitchener National Memorial Fund .. ..	264,000	0	0

### Help Wanted for a Soldiers' Concert.

Sec.-Lt. K. S. Kelway, A.S.C., M.T., B.E.F., France, is getting up a concert at the Front, and will be glad to receive used music or amusing verses for which the present owners have no use.

### Raffling a Motor Cycle.

Commander Johnstone, R.N., who was lost in the Jutland Battle, was an enthusiastic motor cyclist and rode a Lea-Francis. A friend of his, Surgeon H. Trenchard Rossiter, R.N. (also a keen rider), is going to sell the machine by raffling it among the ships at his base.

### Down "Zummerzet."

On Monday we met Lt. I. B. Hart-Davies (R.F.C.), looking very fit and well. He told us that motoring friends of his visiting Porlock had been stopped by the local police and advised to go home, the "locals" apparently being under the impression that motoring had now been prohibited.

### American Twins.

A letter in our last issue from Capt. A. Lindsay, R.G.A., on the subject of American motor cycles, has drawn quite a batch of letters from readers, a selection from which will appear next week. A good many of the correspondents, however, connect Capt. A. Lindsay, R.G.A., with Capt. A. Lindsay, M.B., R.A.M.C. It is perhaps well for us to explain that, so far as we are aware, the two writers have no connection with one another.

### Mail Delivery by Motor Cycle.

A paragraph under this heading in our issue of August 17th referred to the use of motor cycles in the United States for country postal work. According to latest reports, only sidecarriers will be allowed, the previous report that solo machines might be used having been modified. The assistant postmaster who has charge of the U.S.A. rural mail deliveries is highly in favour of the use of motor cycles for this class of work, but believes a sidecarrier necessary to avoid mishaps which might finally result in a ban against the motor cycle altogether.

### The Arbuthnot Trophy Fund over £180.

The following additional subscriptions to the Admiral Arbuthnot Trophy Fund have been received during the last week by the secretary of the Auto Cycle Union, 83, Pall Mall, S.W.:

Jointless Rim, Ltd.	£	s.	d.
Brown Bros., Ltd.	..	5	0
J. V. Pugh, Esq.	..	5	0
Rudge-Whitworth, Ltd.	..	5	0
Norton Motors, Ltd.	..	5	0
A.B.C. Motors, Ltd.	..	5	0
C. Macintosh and Co., Ltd.	..	5	0
The Enfield Cycle Co., Ltd.	..	5	0
H. Collier and Sons, Ltd.	..	5	0
New Imperial Cycles, Ltd.	..	2	0

The total sum subscribed now amounts to over £180. Steps will shortly be taken to have the trophy made, which will take the form of a statuette of the late Rear-Admiral in undress naval uniform.

### Twenty Substitutes Now

We have a list of twenty petrol substitutes in our possession, so that it is not necessary for motor cyclists to cut down their riding to fine limits.

### Motor Cycle Charity Races.

Two motor cycle events figured in the programme of the annual charity sports organised by the Coventry and District Clubs' Alliance, held on Saturday last. The two laps pursuit race was won by S. Wright (3½ h.p. Humber), and the one mile handicap by F. Sibley (Baby Triumph). A photograph of some of the competitors appears on page 214.

### Petrol Supplies—Future Prospects.

At the present time the Government stocks of petrol appear to have largely increased, as deliveries have lately been coming in well. The Admiralty has taken the matter in hand, we are led to believe, and there are now greater facilities for bringing petrol to this country. We are told, however, not to be too optimistic. If things continue to go on as they are doing, and the Government stocks are still further increased, we may hope for a relaxation of the present stringent rules regulating the purchase of petrol by private owners; but if, on the other hand, the Navy or Army demand further supplies, it is quite possible that the present state of affairs will continue, or that even stronger measures may be taken. The daily papers take a very cheery view of the situation, but those who have interviewed authorities on the subject warn our readers not to raise their hopes too highly.

HUFFAM'S PETROL OR PARAFFIN DEVICE.

(See page 185 of our last issue.)

(Right) Sketch of the outside. (Left) Diagrammatic section. (Below) Section of tap in various positions, which, reading from left to right are: Petrol only, paraffin only, petrol-paraffin mixture, and draining the float chamber. It takes the place of the usual jet attachment. Mr. Huffam's address is 21, Treadway Court, Golder's Green, N.W.

### Dust in France.

Lord Northcliffe, in his description in Tuesday's *Times* of his visit to General Birdwood and the Australian troops, remarks that one of the Australians remarked that the dust made him fairly homesick. If the dust in the French war zone is half as bad as it can be in Australia it must be very bad indeed.

### Wounded Soldiers' Sidecar Outing at Devizes.

The population of Devizes is not a large one, but a sidecar outing for twenty-one wounded soldiers was recently held by a number of local motor cyclists. The party went from the hospital at Devizes to Edington via Potterne, Great Cheverell, and Erlestoke. Tea was taken at Edington, and some time was spent boating on the lake there. The outing was so successful that it is hoped to be able to repeat it at a later date.

### Petrol Consumption Records.

Economy in consumption is very much to the fore these days, and, as our correspondence pages testify, many readers are making efforts to get improved results in this respect. Some remarkable runs have been accomplished at one time or another, the most phenomenal perhaps being that claimed by two James riders in the Sutton Coldfield A.C. trial held about three years ago. The machines were both 3½ h.p. twins, specially tuned and fitted for economical running, and the results worked out at 334 and 320 m.p.g. respectively.

At the time considerable doubt was thrown upon these results, including that of the winner of the light car class—a 10 h.p. Singer was credited with doing eighty-seven miles to the gallon. The method of measuring the consumption was the cause of the controversy. The competitors in the Sutton Coldfield trial came to the starting points with tanks full, covered the course of twenty-four miles, the officials subsequently replenishing the tank and checking the amount of petrol required to fill it.

### Latest M.M.G.S. Recruits.

As mentioned in our last issue, the final inspection of recruits for the Motor Machine Gun Service was held at Coventry on Tuesday of last week, when the undermentioned motor cyclists were accepted to await a call from the training centre of the Motor Machine Gun Service, the position of the camp being about to be changed.

In future, as mentioned in the War Office letter reproduced in the recruiting section of our last issue, the method of obtaining motor cyclists for military service will be arranged by the Commands as men are called up.

## A WEEK ON THE ESSEQUIBO COAST.

### TAKING IT EASY IN BRITISH GUIANA.

**T**HOUGH the weather had been very unsettled, on the morning of our start the sun rose in a cloudless sky, and gentle breezes foretold a fair, breezy, tropical day. At 6.30 our 1914 8 h.p. Matchless and sidecar, heavily laden with the various necessities for a week's stay away from our home in Georgetown, left our garage, my brother being my fellow passenger. A quick run of a mile or so and we arrived at the wharf on the east bank of the Demerara River. Having bought tickets, we crossed on the ferry steamer in fifteen minutes. A dig at the kick-starter and the engine purred softly: gently letting in the clutch and accelerating for the climb up the steamer's gangway, we were soon well on our way on the twenty-one mile stretch of winding road along the west coast of Demerara, our destination being Parika, at the mouth of the Essequibo River. The surface along this stretch of road was very indifferent, some places being shockingly bad, necessitating a very slow speed. I may explain that our coastal roads here all run across country which lies below the level of the sea; the roads are made upon raised dykes or dams with a deep wide trench filled with water on either side, so that if there is an accident it means a bath for probably both machine and rider, if nothing more serious. The surfaces are metalled with burnt earth, and when a drought is followed by heavy

rains, as in this case, they become very "pot-hole." Several stops were made to take snapshots of pretty spots, but as Parika had to be reached in time to catch the 8.45 boat for Suddie, on the opposite bank of the

Essequibo, we were not able to make as many stops as we should have liked. The run across the mouth of this huge river, with its many large islands, took three hours, and it was shortly after twelve that the steamer's destination was reached. A run of seven miles and we arrived at our friends' house at Queenstown. The remainder of the day was spent

leisurely; in the cool of the evening a ten mile spin proved very enjoyable.

Rising early next morning, with the large Capoeira lake (area about four-square miles) some few miles inland as our objective, we motored, accompanied by our friends on their James and sidecar, for a mile or so, then, leaving our machines we took to a punt drawn by a mule (these punts are used for carrying canes on the sugar plantations here); at the end of an hour we were on the banks of the lake, then, changing boats and transshipping our baggage, we paddled for the opposite side with its lovely palms, white sandy beach, bathing house, and cool shady bungalow. A very enjoyable day was spent there, bathing and exploring the huts of the aboriginal Indians. At dusk we returned, after a most enjoyable day, all very much sunburnt.

SCENES IN BRITISH GUIANA.

(Top) Matchless and James sidecars used on the holiday tour described in this article.

(Centre) An aboriginal Indian's home.

(Bottom) The party on the lake with boatmen and attendants.

**A Week on the Essequibo Coast.—**

On the succeeding day we motored south along the left bank of the Essequibo River, passing through Suddie on our way to the country beyond. The road in this direction is very pretty, running through avenues of mangoes and palms in places; after passing the seventh milestone from Suddie the road surface is very bad, being grass-grown in the centre (this is generally the case with roads in outlying districts little used). This terminates after the tenth mile in a short stretch of loose sand about 4in. deep, through which it is practically impossible for a motor to proceed; the residents (natives) towards the end of that stretch had apparently never seen a motor cycle and sidecar, and evinced great interest in the Matchless as it glided quietly along. We returned home at 8.40, having covered thirty-six miles; the fresh, cool morning air had put a keen edge on our appetites, and we did justice to our breakfasts. In the afternoon we did a brisk three-mile walk to the bank of the lake, and half an hour's paddling in an Indian dug-out canoe brought us to the sandy shore on the opposite side, where we indulged in a refreshing dip. Before returning home we visited the Indians' hut which had been photographed on the Saturday, in order to show them the photograph; their wonder and interest to see themselves and their home depicted thus were amusing. The open sides of Indian houses may cause some wonder to dwellers in a cold country, but it must be remembered that the mean temperature in these parts is above 80°. On our way home we encountered a troop of monkeys in one part of the forest. It was interesting to watch them disporting themselves, leaping from bough to bough and chattering to one another.

**A New but Bad Road.**

Starting at three on the following afternoon we rode north along the road to the Pomeroon River—the last five miles of the twenty-eight mile stretch from Suddie has only recently been made, and the surface was very bad; the road had sunk abruptly in places, causing holes about 6in. deep. In other parts there was unrolled metal quite 4in. deep, and then again other stretches were grass-grown in the centre, and thus raised high enough to strike the chassis of the sidecar. A speed exceeding ten miles an hour was impossible. The scenery in this part is grand, the road running through virgin forest—gigantic tropical growth on both sides—through which the sun's rays cannot penetrate. We reached the banks of the river at five, and after a look round retraced our way, stopping for tea, which we had brought in a Thermos flask. At this point parrots were flying overhead in large flocks, and we regretted not having a gun with us. A large bag would have been easily possible, for they were flying literally in hundreds, screaming loudly as they went. Our run home was uneventful, we arriving there just after dark.

On the last day of our holiday the greater part of the morning was spent packing. We motored fifteen miles to the steamer at Aurora, 7½ miles on the other side of Suddie, and from there travelled back to Georgetown.

There are not many motor cycles in this colony, and the James and sidecar referred to was the only one we saw on that coast, but several Ford and other cheap American cars were to be seen. We enjoyed a series of absolutely no-trouble runs totalling 170 miles.

C. W. H. COLLIER.

## Are Imports Prohibited? No!

OUR comments under the above heading which appeared in a leading article in the issue of August 17th caused a good deal of speculation. In it we showed that whereas imports of foreign motor cycles were supposed to have been prohibited as from March last, no fewer than 1,020 machines, which together with parts were valued at £99,538, were imported into this country during April, May, June, and July.

We wrote to the Board of Trade on the subject enclosing a copy of *The Motor Cycle* containing the article quoting the official returns, and a reply is now forthcoming and is given hereunder:

[Copy.]  
Board of Trade,  
Dept. of Import Restrictions,  
22, Carlisle Place,  
London, S.W.,  
28th August, 1916.

Sir,

In reply to your letter of 14th August, relative to the importation of motor cycles, I am directed by the Controller to inform you that licences for the importation of motor cycles have been given by this Department only on very rare occasions and for very special reasons, and that from the records in this Department it appears that only a very small proportion of the cycles referred to by you have been imported on the specific authority of this Department.

I am, however, to point out that there is a standing rule whereby goods on the Prohibited list, which can

be shown by means of Bills of Lading to have left their place of origin, consigned to the importer in this country, before the date on which they were prohibited, are admitted into the United Kingdom without special authority from this Department in each case.

I am, sir,

Your obedient servant,

(Signed) H. J. PHILLIPS,  
Secretary.

The Editor,  
*The Motor Cycle*,  
20, Tudor Street, E.C.

A novel spring seat design evolved by a Coventry motor cyclist. The seat is supported on the carrier, which is pivoted in front and sprung on the stout enclosed springs. Observe the 1 h.p. power unit!

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

#### Short Measure of Petrol.

Sir,—During the petrol shortage is it not fair that the Control Committee should enforce the full quantity of two gallons being supplied instead of tins containing about one pint or more short?

I find a good carbide saver is to bore  $\frac{1}{4}$  in. holes in an empty  $\frac{1}{2}$  lb. tin all over the bottom. When the used carbide is put in the tin and shaken, it quickly sifts all the hard from the waste, and keeps the hands clean.

SIDNEY J. WILLIAMS.

#### An Improved Toolkit.

Sir,—The enclosed sketch shows how one can use an old glove for carrying tools, etc., in the saddle bag or one's coat. The rider who adopts this plan will be able to keep his tools handy, and in good condition, and need not go to the expense of buying any ready-made tool carrier. The sketch explains the idea.

J. D. ROBINSON.

#### Decarbonising on Active Service.

Sir,—With reference to a paragraph on page 160 of *The Motor Cycle* of August 24th, we should very much like to know how Mr. Sidney George manages to lubricate his engine (about two-thirds of the work out here has to be done on low gear) so as to keep it so free from carbon. 30,000 miles without decarbonising seems rather "steep," and we should like to employ his methods and obtain similar results. The roads out here are atrocious, and with so much low gear work the engine needs a plentiful supply of oil, also the fuel is a trifle different from the No. 1 used in peace times.

2ND A.M. C. RAINER.

2ND A.M. KERR.

2ND A.M. PATON.

1ST A.M. A. RAYMOND.

B.E.F.

#### American Motor Cycles.

Sir,—Referring to Capt. Lindsay's letter on the American machine, I think he has touched the tender spot of their design, and, despite the occasional speed bursts of these tawdry monsters, the English manufacturer has never had any cause to fear the invasion which, in normal times, was so often threatened.

I am moved to write, however, in defence of one, at any rate, of those "three leading singles" which come in for an undeserved jibe.

Having ridden every model of the leading single from 1907 until 1916, I can only say that those who follow the crowd do indeed "get all they deserve," for their wisdom in purchasing a machine which not only made the motor-cycle trade what it is to-day, but has, by a factory policy of well-informed conservatism, established a steady rock amongst a sea of "talking point" innovators and hasty experimentalists who have many times brought the industry almost to destruction.

At least 85% of single-cylinder engine design is not only influenced by that one leading single, which is so noticeably omitted from Capt. Lindsay's list of representative machines, but is absolutely copied therefrom.

Lest I be accused of having an axe to grind, I will not mention the name of my "leading single," but merely give a clue to its identity by saying that it is most nobly doing its duty in France and other fields, and that the only real complaint the D.R.'s have against it is that on very rough roads the springs of the front forks have been known to break.

D. H. SMITH, M.T., A.S.C.

#### Petrol Substitutes.

Sir,—I wish to call your readers' attention to a small matter which has probably escaped their notice. Previous to the petrol licence age, Binks fuel was advertised at 1s. 4d. per gallon (not bad for paraffin). With the petrol permits it rose to 1s. 10d. It is still advertised at that price, but when one writes for a few barrels the price quoted is 2s. 6d. per gallon. This is a clear case of profiteering. Motor cyclists would do well to keep this in mind when normal times come again. I think these and similar cases ought to be made public.

CW 45.

[The above letter was submitted to Messrs. C. Binks, Ltd., whose reply is appended.—Ed.]

Referring to the above letter, signed "CW 45," in which I am accused of exploiting motor cyclists for my own personal gain, I take this opportunity of repudiating the accusation of your anonymous correspondent. He evidently does not know what he is talking about, or he would not talk such utter nonsense. The price this fuel is sold at is entirely governed by things outside my control, but I would suggest that your correspondent enquires from some shipping house the freightage of oil from California, and then compare it with the rate prevalent every six months since the beginning of the war; he will then begin to understand something of the position. The prices of this fuel are entirely governed by shipping charges. This fuel is sold at practically cost price by me. It would be idle for me to pose as a philanthropist, but nevertheless it is a fact that the whole benefit connected with this fuel concerns the motor cyclists and not myself; also that advertisements have to be sent to your journal some days before they appear, and in the interval the price may go up, and although the fuel may be advertised one week at a certain price it does not necessarily follow that I can sell it at this price, and there is certainly no obligation for anyone to order it at the increased price. If an enquiry is made at our works, they will be told what the price is; if it is higher than the price advertised, it is their option whether they order it, and if they send money without making enquiries this money will be cheerfully returned, provided the higher price is objected to. After reading your correspondent's letter, it is quite refreshing to refer to many hundreds of letters from motor cyclists who have taken the trouble to write and thank me for providing means by which they can use their machines when petrol restrictions are in force.

C. BINKS.

### Removing the Engine.

Sir,—I have lately had occasion to remove and replace the crank case of my  $3\frac{1}{2}$  h.p. T.T. machine, and was at

first rather puzzled how satisfactorily to handle this weighty job. However, the pieces of hard wood I use for running my light car off the pavement into the road solved the problem. They are the usual triangular section, as sketch.

The two were pushed together under the crank case as sketched, and, by just taking the weight, permitted all the bolts to be pushed out with the utmost ease. Drawing them apart lowered the crank case, and allowed it to be withdrawn from the

frame. The process was reversed to assemble the crank case again in the frame.

J. W. G. BROOKER.

### The Boycott of German Goods.

Sir,—It is with extreme indignation that I read Mr. H. Pritchard's letter in *The Motor Cycle* of August 24th. I should like to deal with it paragraph by paragraph.

Firstly, I flatly contradict his statement that muddling diplomacy on both sides caused the war. This contradiction he admits in his second paragraph, where he remarks that we entered the war for the purpose of defending Belgian neutrality. How does he reconcile his two statements?

To take the third paragraph. Is it necessary to compare our motors with German motors? Is there not a sufficiency of all branches of science and engineering in the world for purposes of comparison without the admission of the German variety?

His fourth paragraph is nonsensical. The remainder of the war will inevitably be, for Germany, a war of defence, but nothing could possibly give her the "justification" for saying that the whole war was a war of defence. Has there ever been a more definite war of aggression?

To take his last paragraph next, I beg to state that it will be very much to the credit of Great Britain to have crushed German trade *everywhere* by force of arms (I take strong exception to his expression "political trickery"); it is a form of punishment particularly suited to Germany, as well as being a protection to ourselves against the dumping of German goods and also the "peaceful invasion" policy so beloved of that nation. I believe our object during and after this war is not to help Germany out of her shibboleth of Kultur, but to reduce her to such a condition that she is incapable of inflicting its results upon other nations, and, to deal with Mr. Pritchard's fifth paragraph, the above punishment is the only way we shall have of attaining that end. If it appears to him too drastic, let me remind him of the authenticated atrocities; possibly if he were to see even some of the sights I have seen he would change his mind. I presume he is not thinking of moral suasion!

M.R.C.S.

### The Cause of Overheating.

Sir,—With deep interest I read your leading article in the last issue of your interesting paper, on "Overheating and Engine Stops," and beg permission to add my opinion, which, while not being the entire cause of stoppage from overheating, has undoubtedly a great influence on the usual symptoms of overheating.

Knowing that internal combustion engines depend for their maximum power upon a volatile fuel, which, when mixed in correct chemical proportions with oxygen (air) and exploded, occupy greater volume than previously, we assume that the greater the variation in the cubical contents before and after, the greater the power generated. Heat generated by the explosion of the mixture causes the cylinders of air-cooled engines to become very hot, and the tendency must be to heat the incoming mixture, or *vice versa*, to allow much less to occupy the cylinder space due to the expansion of the gases on the suction stroke. Boyle's law of expansion of a gaseous mixture says that

"gases expand  $\frac{1}{273}$  (one two hundred and seventy-third) of its volume for every rise of one degree in temperature." Therefore, if a cylinder heated from, say,  $50^{\circ}$  F. to  $300^{\circ}$  F. were still working, it follows that (being only a 500 c.c. engine) half the quantity of power will be generated, due to only half the quantity of gases being admitted.

My opinion is that, as the heat increases, the mixture allowed to enter the cylinder decreases, until the quantity entered is so small that after explosion the increase in volume is so small that power drops off and the machine stops. Upon cooling again, the engine is willing again to generate full power, when perfect vaporisation takes place at the lowest possible temperature.

While not wishing to deprecate the ideas of your correspondent, I hope my theory may be enlightening.

CLIFFORD C. FENTON.

Sir,—With reference to the article in your issue of the 31st ult. by Mr. C. H. Stephenson I beg to call attention to the following: The immediate cause of electric conductivity in a gas is not rise in temperature but ionisation. Pure gas, free from ions, has a very high resistance. The passage of the first spark increase the ionisation, thereby reducing the resistance of the gas in the gap. Ionisation by any other means, e.g., by X-rays, has the same effect.

What proportion of ionised gas may remain in the cylinder; how this will affect ignition at continued high engine speeds; the value of high temperature as an ionising agent on the gases in question, are all matters for investigation.

I have neither time, apparatus, nor reference literature to deal with these points at present, and I prefer not to write without authority. I therefore content myself with referring your correspondent, and others interested, to the chapter and references appended on the subject in Mr. W. C. D. Whetnam's excellent book "Experimental Electricity."

W. J. CRUTCH, B.Sc.

Lt., R.W. Fns.

### War Time Economy.

Sir,—When I come across a good thing I think it is only fair that others should know of it, and for a really economical little carburetter fitting, easily fitted by any amateur, I would recommend the Wilkinson by-pass as fitted to my own old pattern Amac carburetter on a 6 h.p. twin Jap. The illustration will explain. It is fitted into the back of the carburetter body, not into the inlet pipe, so that it can be easily removed with the carburetter intact; and in the position in which I have it it gets the hot air from the front cylinder head, and I find that, with the milled cap controlling jet one-fifth of a turn open, I can get even firing on both cylinders with main throttle shut, and 72 m.p.g. instead of 50 m.p.g. It stands to reason that the running on pilot alone gives maximum economy. Of course, the throttle must be opened occasionally when hill-climbing, but the running on the pilot jet only on the level is excellent. It also has another advantage, in that if the main throttle wire breaks at any time one can always run home on the pilot jet alone, as it can be adjusted from the saddle easily. The usual disclaimer.

C. PALMER.

Wilkinson by-pass attached to Amac carburetter on a 6 h.p. J.A.P. engine. (See accompanying letter from C. Palmer.)

### Petrol Allowances.

Sir,—I have been much interested in the controversy arising out of the petrol licences and the tests of petrol and paraffin as fuel for motor cycles.

As we motor cyclists have been done a great injustice by the meagre allowance of petrol allotted to us, I contend that when petrol, which is now a mixture of, say, 50% paraffin, is purchased, only the actual amount of pure petrol be inserted on the licence. By taking my proportion of paraffin in petrol we could then get twelve gallons of fuel for our cycles in three months.

The point arises as to whether this procedure comes within the meaning of the Act. A.P.R., R.N.

Sir,—I would like to know if any reader of *The Motor Cycle* has been served as I have. I see by the papers that all applications for petrol sent in at the proper time have now been dealt with. I do not know how I can obtain my present supply. My census paper was filled up, and returned from my local post office in July with postal order for 3s. I have written to the Petrol Committee three times, but cannot get any reply. H. CHADWICK.

Sir,—My treatment at the hands of the Petrol Committee may interest you. I am a special constable and use my Douglas for police work *only*—at my expense, of course. I am the only motor cyclist attached to our station, and I have very important duties to carry out in the event of air raids. In my petrol census return I asked for three gallons per week, and was granted the usual six gallons per three months. This I promptly returned, with a certificate from my inspector, pointing out my important duties, to which they replied, "That owing to the shortage," etc., they were unable to grant me more than six gallons per month. SPECIAL.

Sir,—I am the relieving officer and registrar of births and deaths for a country district covering 25,000 acres with no railway facilities. I have to go round my district weekly for relief and registration purposes, covering at least eighty miles per week. I asked for six gallons of petrol per month; granted six for three months. The same amount is allowed to motor cyclists for pleasure. It is quite evident some business men are required on the Petrol Control Committee. H. W. FETCH.

### The Silver Paraffin Vaporiser.

Sir,—I have read Mr. Durant's remarks with interest, but from experience I generally mistrust such sweeping assertions of lack of novelty so glibly put forward.

In the present case I have little faith in the allegation, if it is no more accurate than the statements: first, that if the device were protected in 1903 "the patent would have expired" (ignoring the fact that British patents may last for fourteen years), and, secondly, "no protection numbers stamped on it *such as the Patent Office requires*." (There are no such requirements.) H.W.K.J.

Sir,—I should be obliged if you would allow me through your columns to contradict Mr. A. Durant's statement, in so much that no letter from me has been sent for publication prior to this, *re* vaporiser, to any editor. No vaporisers have been sent out or fitted to a motor cycle for public use; therefore Mr. Durant could not have seen it, as he alleges.

Further, I may remind Mr. A. Durant and your readers that the vaporiser as fitted to the Quadrant is fully protected, and doubtless the Quadrant people are sufficiently intelligent to know how to protect their rights. T. SILVER.

Sir,—Referring to Mr. Silver's vaporiser, the idea is not new, for in 1904-5 I fitted a similar arrangement to the induction pipe of a Humber tricar to counteract the abnormal condensation in the very long induction pipe with which, you may remember, that machine was fitted. The jacket was connected up with a Y piece to the same pipe that conducted hot gases from the exhaust pipe to the Longuemare carburettor heating jacket, and both the jacket and induction pipe had to be heated when running on the so-called Borneo spirit, which I used at that time, otherwise the engine fired very erratically or not at all in cold weather.

I have in the making and shall fit a similar arrangement to my present machine, though I am not using paraffin, but another substitute which requires vaporising.

The arrangement is only an adaptation of the vaporiser of oil engines of the Priestman and other types, and is such common knowledge that it will be fitted by the majority of engineering motorists within a short time, and no doubt they will be thankful that a manufacturer is in a position to supply them, should they not have time to be able to make it themselves. ADAPTABLE.

Preston.

### Three or Four Wheels?

Sir,—There is a truism in Mr. S. L. Burnard's letter, which appeared in your issue of August 31st. He remarks that abuse is no argument. Perhaps that explains why so little notice was taken of his previous letter! Who started the abuse?

Mr. Burnard's views may be typical of those of a large section of the motor cycling community, but will their views be the same in five years' time as they are to-day? Surely we should judge an invention by its future value, and the question of appearance at the outset is of minor importance. And I might ask how many machines—both sole and combination—at present on the market can be considered as anything but ugly? The majority—yes, the majority—are clumsy, ungraceful, and inartistic. There are a few—the A.B.C., the Henderson, the Allon, the Lea-Francis, and the Scott which are actually pleasing to the eye. Yet six years ago the Scott was laughed at, simply because it was unconventional. And who dare laugh at it to-day? So Mr. Burnard had better ask himself whether he is not at present in the position of the scoffers of six years ago.

At any rate, I intend buying a Scott motor cycle next spring, and I hope one day I shall have the pleasure of meeting Mr. Burnard in his new Scott sociable, his face wreathed in smiles. NORMAN WILLIAMS.

### A District Nurse's Mount.

Sir,—Your readers may be interested to hear that I am finding a 24 h.p. two-stroke lightweight Levis extremely useful for covering a scattered district, where I am working during the war. The second day of possessing my machine I did forty-five miles, revisiting an ex-district. It was only my third time on a solo machine.

I am having great satisfaction and practically no troubles from the bicycle, and the small troubles that have occurred are merely those through over-oiling and other amateur mistakes from which, I expect, we all suffer at first.

I strongly advise all war workers, especially women, who have distances to go, to obtain a lightweight and be independent of these present-day erratic train services. I find a pair of overalls over my skirt and apron and a short, narrow nurse's cloak over that, quite easy for both riding and working purposes. NURSE PA 2282.

A nurse who uses a Levis in her professional duties.

#### Volex MOTOR CYCLE LIGHTING.

##### "VOLEX" DRY BATTERY MOTOR CYCLE HEAD LAMP OUTFIT.

Also supplied in  
Sidecar Outfit at  
same price.

Includes "Volex" Giant Dry Battery, Conducting  
Cord, Switch, and Penetra Motor Cycle Head or  
Sidecar Lamp, with Bulbs.

Price 32/6 complete outfit.

The battery can be fitted in Sidecar Bottom or  
carried in Satchel which can be attached to the  
frame or Motor Cycle. The Dry Battery will  
give about 80 hours' light, and will hold up in  
stock for over 12 months.

Spare "Volex" Giant Battery, 6/6.

##### THE "VOLEX" GIANT DRY BATTERIES.

For Motor Cycle and Sidecar  
Lighting and Ignition Starting  
they are excellent, and have no  
superior. "Volex" Batteries are  
recommended for export.

4 volts, size 6 1/2 x 3 in. square, 6/6  
each. 6 volts, size 6 1/2 x 4 x 3 in.  
8/6 each.

##### THE "VOLEX" AERO DRY BATTERY. British Made.

A very convenient  
size for many pur-  
poses, such as Motor  
Cycles, Cycle Caps,  
etc. Suitable for igni-  
tion, lighting, electric  
horn operation. Holds  
up in stock for years.

4 volts, size 6 1/2 x 4 1/2 x 2 1/2 in. .. Price 8/-.  
6 volts, size 6 1/2 x 6 x 2 1/2 in. .. Price 11/-. ..

##### THE "VOLEX" EMPERAL BATTERY. British Made.

Of particularly heavy capacity,  
recommended for Motor Car,  
Boat, or Engine Ignition; for  
lighting, actuating horn, etc.  
Recommended for export, and  
in conjunction with our  
"Volex" Special Metal Filament  
Bulbs about 150 to 200  
hours' light is obtainable.

4 volts, size 6 1/2 x 7 1/2 x 2 1/2 in. .. Price 10/6.  
6 volts, size 6 1/2 x 5 x 5 in. .. Price 14/6. ..

##### THE "VOLEX" Special Metal Filament Bulb

For use with our  
"Volex" Dry Bat-  
teries, ensuring  
maximum burning  
hours. 4 and 6  
volts, min screw  
cap, 1/- each. 4  
and 6 volts, small  
B cap, 1/6 each.

##### "VOLTALITE."

Self-Generating Electric Motor Cycle LAMP.  
British Made. The FIRST Cost the ONLY Cost.  
The lamp which produces by the movement  
of the machine an inexhaustible supply of  
electric light to illuminate brilliantly the  
head lamp at no cost whatever. Fitted with  
Hoffmann Ball Bearings. Complete with  
head lamp and metal filament bulb, ready  
for use, £4/4. Post free.

## A TWO-STROKE AFTER 800 MILES ON PARAFFIN.

WE know of a rider of a Scott who has been experimenting with paraffin and paraffin-petrol mixtures, and has now covered over 800 miles with this fuel, the last 600 miles having been run entirely on neat paraffin, petrol only having been used for starting purposes. Fearing lest unevaporated paraffin might be having detrimental effects on the piston rings and bearings, the engine was recently dismantled, and it is interesting

to hear that all the rings were quite free in their grooves, while the amount of carbon deposit anywhere was extremely small and of a decidedly soft nature. All the bearings were in perfect condition, and seemed amply lubricated. A Zenith carburetter was used without any device for heating the fuel, not even a hot air intake. Heat is most necessary if the best results are to be obtained from heavy fuels.

## A WEEK-END CHARITY RACE.

Motor cyclists who competed in the two lap pursuit race that formed part of the programme at the Coventry and District Cycling Clubs' Alliance annual charity sports held on Saturday last.

## THE KAY QUICK-STARTING DEVICE.

IN view of the restriction in petrol supplies at the present time, motorists have found it necessary to use one of the many petrol substitutes now on the market. The greatest objection to the use of these substitutes is the difficulty of starting the engine when cold. With the use of the device in our illustration (designed and patented by Mr. Kay, of Halliwell, Bolton) this trouble is avoided, and the only thing required when starting the engine is to turn on the tap of the small auxiliary tank. The engine will then start in the usual way, although the carburetter may,

Key adjustable needle valve for supplying petrol to the induction pipe.

be full of substitute. When under way the tap should be turned off, and the engine will continue running on the substitute.

The device consists of a small drip-feed needle valve, screwed into the inlet pipe, which is set to suit the engine, and does not again require to be touched. The petrol is fed from a small auxiliary tank fitted under the main tank. It can be fitted to any engine when a small hole has been drilled and tapped in the inlet pipe. The use of petrol with this device is practically infinitesimal, and half a gallon of petrol would last for a long period.

### THE PEACOCK VAPORISER.

THIS is a little contrivance which when placed in the induction pipe is claimed to increase the vaporising surface and also to transmit heat along the induction pipe, and thus tends to

A new generator bracket suitable for fixing to the handle-bar or frame, produced by the F.R.S. Lamp Co., of Pershore Street, Birmingham. The clip is finished dull black and other parts are plated.

check the entrance of any liquid fuel into the engine. When paraffin is used this is a point of considerable importance. The device is manufactured by Peacock, Cobb, and Co., of Birmingham.

# QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street London, E.C., and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

## Broken Valves.

?

I have a Calthorpe Junior, which causes a lot of trouble with exhaust valves breaking. Can you suggest a remedy for this?—W.T.

Your trouble is probably caused by any of the following: Valves made of poor material. Overheating, caused through too large a jet, or a choked exhaust outlet. Incorrect valve timing, exhaust valve opening too early, or retarded ignition. Too strong valve springs. Driving too hard.

## Law Regarding Brakes.

?

I have just purchased a motor cycle, and should be pleased if you will give me advice on the following question: The machine is second-hand, and is only fitted with one brake (front), and the machine does not appear to ever have been fitted with another, but I am told that it is breaking the law to ride with less than two. Is this so?—H.F.C.

Yes, it is illegal to ride a machine fitted with only one brake, besides being extremely dangerous using one fitted to the front wheel only. You will probably be able to obtain a belt rim or band brake from any large accessory firm.

## Racing Engine in Free.

?

In the "Questions and Replies" section of your valuable paper of August 10th "N.B.H." writes you re 8 h.p. J.A.P. carburettor trouble, and you reply that allowing the engine to race in free owing to a leaky throttle is likely to do damage to the engine. I have had the same symptoms with my 5-6 h.p. twin overhead J.A.P., but have felt no inconvenience until recently. My big end ball races seized up without warning. Would you attribute this seizure to be caused by too rich a mixture, as the lubrication is O.K.? The carburettor is a J.A.P. with barrel (revolving) throttle, which to all appearances closes tight, but yet supplies enough mixture to run the engine when it is shut off.—E.

A seized big end is more likely to be due to lack of lubrication. Allowing the engine to race when in free does considerable damage to it, ruining the bearings and generally wearing the engine out. Your throttle barrel may be worn, which causes it to allow a certain amount of gas to escape. Perhaps you have rather too large a jet fitted.

## Running on Acetylene.

?

In view of the possibilities of acetylene being used as the motive force for motors, I should like you to answer the following questions: (1.) Would an ordinary cylinder casting withstand the extra strain of the explosion? (2.) Is more air required for acetylene than for petrol? (3.) Would the explosion be more violent and require a later timing?—V.M.

(1.) Acetylene is a very dangerous gas to use as a fuel, as the explosion is more in the nature of a detonation than an explosion. The average cylinder would not stand the explosion of a full charge. (2.) No, about the same proportions, but, if anything, slightly more. (3.) This is answered in No 1. The ignition timing might require to be retarded.

## IMPORTANT NOTICE.

### GOODS MADE IN GERMANY.

The proprietors of this journal, being fully in accord with the recommendations agreed upon at the Paris Economic Conference, give notice that they will not permit the advertisements of new goods manufactured in enemy countries to appear in this publication, either during or after the war.

ILIFFE & SONS LTD.

## Cylinder Angle.

?

I have an early model 5 h.p. twin-cylinder machine with accumulator and coil ignition. How can I tell the angle degree, as I wish to fit a magneto to this machine, as it is a good puller and worth the expense? I should say the date is about 1907.—G.B.

If the makers of your machine are unable to tell you the angle of the cylinders it will be necessary to measure the angle at which the cylinders are set in relation to the crankshaft. We think perhaps the easiest way to do this would be as follows: Take a piece of paper and make a template exactly corresponding with the base of each cylinder. Continue these lines until they meet, then with the aid of a protractor, a small instrument which you can purchase at most stationers for a few pence, measure the angle of the lines so formed by the two cylinder bases. When you have ascertained this angle subtract it from 180°, and it will give you the angle at which the cylinders are set.

## Timing the Spark.

?

I have a new 2½ h.p. two-stroke single-speed motor cycle. I have had to return the magneto to the makers. Would you kindly tell me (1) the easiest method of timing when I replace the magneto? (The thing I do not really understand is how to measure the correct distance of the piston from the top of its stroke before replacing the magneto chain.) (2.) Would it be any advantage to have a longer exhaust pipe (for silencing purposes)? (3.) Would a too small jet make any great difference in hill-climbing?—T.H.V.

(1.) The following is the correct method of timing the ignition: Place piston at the top of its stroke; this can be ascertained by putting a wire through the sparking plug hole, and feeling when the piston has travelled as far up the cylinder as possible. The ignition lever should be fully retarded, while the chain should be connected up with the contact points just about to break. (2.) Yes, a long tail pipe to the silencer renders a machine much more silent. (3.) A small jet reduces the power to a certain extent, and so will too large a jet. This also causes four-stroking, while a small jet may cause popping in the carburettor.

## Compression Ratio.

?

(1.) I understand that the compression of a Douglas engine is very low. What should it be? Is there any way of testing it short of using a compression gauge? (2.) I understand that a magneto generates an alternating current. That being the case, would a two-cylinder magneto produce an alternating or direct current at each plug respectively? (3.) At how many revolutions per minute is the horse-power of an engine usually rated at?—G.B.S.

(1.) You can find the compression ratio by measurement, but the actual pressure can only be found by means of a pressure gauge. The pressure, as a rule, will be between 60 lb. and 70 lb per sq. in. The ratio is usually about 4 or 5 to 1. The compression ratio is obtained by dividing your compression space plus piston displacement by the compression space, which gives you a ratio of so much to 1. (2.) The current generated in the primary winding of any magneto is alternating, but the current at the plug points is best described as merely an electrical impulse, as it could hardly be described as either alternating or continuous. (3.) At about 1,500 to 2,000 revolutions.

**Knocking on a Two-stroke.**

**?** Can you tell me what is the matter with my 1916 two-stroke, fitted with Dixie fixed ignition? Unless I time it practically on top of the stroke (about 1 to 1½ mm.) the engine knocks horribly. The other day on a run I was troubled with this all the way, and stopped at the bottom of Reigate Hill to cool down (ignition then advanced about 5 mm.). I ascended the hill well with no trace of knock, and the bicycle ran twenty miles home magnificently, very fast, and no knock. Recently, however, it started again (pure petrol).—C.G.D.

Your trouble may be due to excessive carbon deposit or a faulty plug, causing pre-ignition, or to either poor or insufficient lubricating oil. You should be able to give at least 5 mm. advance. Make sure the piston top is quite clean, and that the piston rings are not gummied up in their grooves—a common fault with air-cooled two-strokes.

**Grinding Noises.**

**?** About a month ago I bought a 3½ h.p. Rudge-Multi from a garage owner, and it does not give me satisfaction. There is always a heavy grinding noise from the engine. I am told it is the plate clutch. At times the engine makes a tinkling noise, which is very infrequent now. The engine overheats very much and very quickly, and pulls badly on the level and hills. Even on the lowest gear it pulls badly on hills. There is plenty of compression, and recently I got the valves ground and the piston and cylinder cleaned, but it has made no alteration or change in the running. There is a slight bend in the petrol pipe, but it gets sufficient petrol. The other day I found it hard to start as the engine was too hot, seemingly. I put a new plug in, and it immediately fired, but began to misfire very much. I then cleaned the old plug and got started, and it fired all right. I wonder if the timing has slipped a little?—S.B.

It is almost impossible to say what is wrong with your machine without actually seeing it. The cause of the grinding may be due to a broken ball race either in the gear or the engine. We can only advise you to overhaul the gear and the engine thoroughly, and see that there is nothing binding or rubbing anywhere, and that all parts, including the clutch, are adequately lubricated. The overheating may be due to any of the following causes: Too large a jet, choked exhaust outlet, and insufficient valve lift, perhaps due to too great a tappet clearance. Whatever is causing the grinding noise may also be responsible for the overheating, owing to the friction. The bend or kink in the petrol pipe would not cause the trouble. The misfiring was probably caused either by the new plug having the points wrongly adjusted (there should be a gap of about ⅜ in.) or by the plug being faulty. The timing would not have this effect.

**Too Rich a Mixture.**

**?** You may be able to offer some suggestion as to the solution of a little puzzle I am experiencing. My mount is a two-stroke, petrol lubrication. Recently a sudden loss of power occurred, and as a lot of oil was thrown out from the joint of crank case, I thought this might be due to a loss of crank case compression. This was remedied by a brown paper and seccotine packing, and at the time of taking down a rather large collection of carbon was found in the transfer passage. This and all other parts were cleaned, and on the return of the machine to the road I found its old power had returned with interest. After the first journey, however, it has now developed another symptom. Whenever a start is made from cold (or after the engine has ever so slightly cooled down during a stop) remarkable difficulty occurs in starting. Usually it immediately fires the charge about twice, and then, running along with the momentum this gives, stops firing. A quick manoeuvring of throttle and extra air (without any defined method, so far as I can see) usually then starts it eight-stroking for about twenty yards or so, then four-stroking for about a further fifty yards, and finally, in about 150 to 200 yards, it settles down to the correct two-stroking, and gives no further bother until the next stop and cool down. Sometimes this procedure is varied, and, instead of eight-stroking, it merely smothers the plug with oil, and no firing of the charge then occurs at all. When this happens, patient changing and cleaning of plugs have to be done until, finally, a charge or two is fired. Magneto spark occurs a good ¾ in. from top of compression stroke.—S.A.P.

Your trouble is evidently due to too rich a mixture, which perhaps you did not notice previously owing to the leaky crank case joint. Try a slightly smaller jet.

**EXPERIENCES WANTED.**

"R.S.J." (Heversham).—8 h.p. British Excelsior. Consumption and reliability.

"J.W." (Grantham).—Rudge Multi and sidecar. Most suitable belt; also petrol consumption.

**RECOMMENDED ROUTES.**

**BRIGHTON TO TIDWORTH.—H.R.A.**

requirements permit.*

The **ONLY BELT** for Gradual Gears.

THE  
"ZILLA" BELT  
LEATHER & RUBBER.

**UNBREAKABLE:** Because the whole pulling strain is taken by a steel chain core, manufactured to withstand from 3 to 4 times the pulling strain of any motor cycle yet built.

**NON-SLIPPING:** Because the leather and rubber washers on the chain have 50% greater driving surfaces than leather or rubber belts, and the combination of leather and rubber will grip the driving pulley in any weather.

**FASTER DRIVE:** Because the washer and chain construction gives a flexibility which allows the Zilla Belt to "hug" the smallest pulley without that great internal friction, and force required to bend an ordinary belt round it.

**JUST THE THING FOR SIDECAR WORK,** especially in changeable weather or in exposed positions.

THE BELT THAT SAVES 10% OF PETROL.

## READ!

### MY 3-PHASE JET DAMPING CARBURETTERS

have such perfect vapourising properties that they enable you to use fuel at 2/6 per gallon in 42-gallon casks, which you are allowed to keep on your premises. Your engine will tick over dead slow, and pull dead slow in traffic, yet give the full power. It is almost impossible to tell you are not running on petrol at 2/9 a gallon. It cannot damage your engine or soot it up, and makes Motor Cycling possible in these times.

I give you my personal assurance of the truth of what is stated above. Please send at once for full particulars of the carburetter, and also for my Treatise on Carburation, and terms of One Month's Approval Trial.

## C. BINKS, Ltd., Eccles.

# MISCELLANEOUS ADVERTISEMENTS.

## PRICES.

**ADVERTISEMENTS** in these columns—First 12 words or less 1/6, and 3d. for every two words after. Each paragraph is charged separately. Name and address must be counted. Series discounts and special terms to regular trade advertisers will be quoted on application.

Postal Orders sent in payment for advertisements should be made payable to **ILIFFE & SONS Ltd., and crossed** & Co.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

## NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge. Only the number will appear in the advertisement. All replies should be addressed, "No. 000, c/o 'The Motor Cycle,' 20, Tudor Street, E.C."

## DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal to perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £20 in value, a deposit fee of 2s. 6d. is charged, when under £20 the fee is 1s. All deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

## SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

## DEFENCE OF THE REALM ACT

Under the provisions of the above Act, advertisers requiring workmen, and whose business consists wholly or mainly of engineering or the production of munitions of war, or substances required for the production thereof, and whose works are situated within 30 miles of London, must include in every such advertisement the words, "No person resident more than 10 miles away, or already engaged on Government work, will be engaged."

Advertisers whose works are situated more than 30 miles from London can only have their announcements inserted with the approval of the Board of Trade, who will allocate to each advertisement a box number, and collect and distribute to the advertiser all replies received. The necessary forms of application can be obtained from any Labour Exchange or from the offices of this paper, and each advertisement must contain a clear reference to the effect that no person already engaged on Government work need apply.

# FORWARD

When the Fastener fails and you're "miles away from anywhere"—well, there's trouble, to put it mildly—

And all to be avoided if you fit the **FORWARD**—the fastener that never fails!

Here are two patterns—

THE "FORWARD," price 1/6—a fastener that has been proved to be the strongest, the best finished, and the most efficient on the market. Made in  $\frac{1}{4}$  in.,  $\frac{1}{2}$  in.,  $\frac{3}{4}$  in., 1 in., and 1  $\frac{1}{2}$  in.

THE "KING HOOK" (adjustable), price 1/3—"King of the Hook Types," and made with double strength hooks, which are guaranteed unbreakable. (Detachable pattern, 1/-)

And the "FORWARD" LEATHER COVERED LINK, price 1/- ("King Hook" Leather Covered Link, 10d.) All sized except  $\frac{1}{4}$  in.

Now, wouldn't it be better to avoid the risks of inferiority—think it over, and ask us for Catalogue.

**FORWARD MOTOR CO.,**

35, Forward Works,

Summer Row, Birmingham.

## Humber.

HUMBER Lightweight, lamps, spare belt, etc.; £15/15.—Danie, Peldon, Colchester. [X6728]

3 1/2 h.p. Humber, 2-speed, splendid condition; £21.—W. and H. Motor Co., Ltd., 287, Deansgate, Manchester. [1254]

3-SPEED Humber Combination, like new, all accessories; £50.—Leighton's, opposite Wood Green Station. [1550]

2 1/2 h.p. Humber, neat lightweight, absolutely perfect, tyres as new; £14.—Davies, Bulkeley Rd., Poynton, Cheshire. [X7034]

HUMBER, 2-speed, free engine, handle start, running condition; £12, or offer.—304, Woodstock Rd., Oxford. [1421]

3 1/2 h.p. Humber Motor Cycle, Roc 2-speed gear, handle starting, excellent condition; bargain, £14/10.—Parker, St. Giles, Oxford. [X7008]

3 1/2 h.p. Humber, 2-speed, handle starter, sound order, 2 new tyres, fully equipped; £22.—Grocer, 30, Park Av., East Ham. [X6910]

1915 3 1/2 h.p. 3-speed Humber, brand new; £55.—Exeter Motor Cycle Co., Ltd., Bath Rd., Exeter, and Tavistock Rd., Plymouth. [0844]

HUMBER, 1912, 2-speed, free, and sidecar, in exceptional condition; any trial; £20, no offers.—14, Dodbrooke Rd., West Norwood. [1546]

## MOTOR CYCLES FOR SALE.

## Humber.

1912 3 1/2 h.p. 2-speed Humber, with coachbuilt sidecar, in good order; £32/10.—Exeter Motor Cycle Co., Ltd., Bath Rd., Exeter, and Tavistock Rd., Plymouth. [0842]

1914 4h.p. Humber, water-cooled, 3 speeds, clutch, and handsome coachbuilt sidecar, excellent hill-climber; £50.—The Barnes Motor Garage, opposite Red Lion, Barnes, S.W. [1473]

HUMBER, 3 1/2 h.p., F.E., wicker sidecar, 2 speeds, Philipson, decompressor, tyres as new, complete kit, hardly used last 18 months, sole cause selling, perfect order; £32.—Lient. Ross, Ordnance Depot, Dover. [X6909]

1913 Humber, 3 1/2 h.p., and cane sidecar, Bosch, B. and B. P. and H. lamps, good tyres, one new, Pedley belt, adjustable pulley, horn, spares, overhauled, splendid condition; £32, or close offer; must sell.—10, Crawley Rd., Wood Green. [1484]

HUMBER, 1915, water-cooled, 3-speed, free engine, clutch, kick-start, Mills-Fulford sidecar, tyres unpunctured, complete with lamp set and horn, combination not run 1,500 miles, in genuine new condition; cost £85, will accept £57/10 for quick sale.—Wm. Betts, Ltd., Motor Cycle Dept., 96, Upper Richmond Rd., Putney, S.W. Phones: 1766 and 1698 Putney and Wimbledon 1167. [1609]

## Indian.

5-6h.p. Twin Indian, little used, mag., etc.; £18.—10, Norwood Crescent, Southport. [X6648]

1913 T.T. Red Indian, 7-9h.p., clutch, lamp, etc.; £30.—80, Bishopham Rd., Southport. [X6646a]

INDIAN, 1915, 3 1/2 h.p. twin, 3-speed gear, very little used; £45.—Jones, Hurst Nook, St. Annes-on-Sea. [X7035]

1915 5-6h.p. Indian, 3 speeds, fully equipped, small mileage, as new; £47/10.—Alfred Proctor, Chesham, Bow. [X6980]

INDIAN, 7-9h.p., 3-speed, 1915, spring frame, brand new Canoelet sidecar; £65.—Dominy, Jewry St., Winchester. [1431]

LOOK Here.—Genuine 1914 clutch model kick starter Indian, perfect condition; £34 secures this wonderful bargain.—Millard, Chesterfield. [X7082]

INDIAN, 7-9h.p., splendid condition, electric lamps, kick starter; £45; take good gun part payment.—Bates, 3, St. George's Gate, Canterbury. [1313]

7 h.p. 1914 Indian, 2-speed and free engine model, very powerful and fast, spring frame; £35; guaranteed.—Wauchope's, 9, Shoe Lane, London. [1461]

INDIANS, model C, in stock for immediate delivery, spring frame, 3 speeds, 2 electric lamps, and horn, also speedometer; £78.—P. J. Evans, John Bright St., Birmingham. [X7057]

5 h.p. Indian, late 1915, 3 speeds, kick starter, run about 2,000 miles, original Dunlop tyres, in excellent condition throughout, accessories; £48.—S., 41, Ash Rd., Stratford. [1354]

INDIAN 1916 Powerplus Model, with coachbuilt sidecar, guaranteed not ridden 80 miles; a bargain at £80.—Exeter Motor Cycle Co., Ltd., Bath Rd., Exeter, and Tavistock Rd., Plymouth. [0839]

7-9h.p. 1915 Indian and Sidecar De Luxe, 3-speed, clutch, chain drive, and kick-start model, electric lighting set, electric horn, mirror; 70 gns.; guaranteed.—Wauchope's, 9, Shoe Lane, London. [1468]

INDIAN Powerplus, 7h.p., 3-speed, T.T., rigid frame model, Dunlop tyres, £75; spring frame touring model, £85.—In stock for immediate delivery at P. J. Evans, John Bright St., Birmingham. [X7056]

BIRMINGHAM Indian Agent, P. J. Evans, 87-91, John Bright St.—Immediate delivery, ex-stock, 5h.p. 3-speed standard and sporting models, with and without sidecar, price £70; sidecars from 11 gns. [X7056]

INDIAN Powerplus Combination, 1916, 7-9h.p., 3-speed, spring frame, dynamo lighting set, horn, and speedometer; cost £111, used few trial runs only; sell £100, or exchange late 2-seater car, cash adjustment.—Apply, Box 752, c/o The Autocar. [X6905]

INDIAN Powerplus Combination, 1916, 7-9h.p., 3-speed, spring frame, dynamo lighting set, horn, and speedometer; cost £111, used few trial runs only; sell £100, or exchange late 2-seater car, cash adjustment.—Apply, Box 751, c/o The Motor Cycle. [X6906]

1913 Indian Combination, 7-9h.p., 2-speed, clutch, spring frame, coachbuilt sidecar (cost £25), large P.H. lamp, Lucas rear, speedometer, horn, and spares, in splendid condition, ready to ride away; £55; evenings.—Weyang, 20, Wolseley Av., Wimbledon Park. [1438]

P. J. EVANS, Birmingham and Midland Indian Agent.—All models in stock for immediate delivery; 5h.p. 3-speed model, £70; 7h.p. T.T. Powerplus, £75; 7h.p. 3-speed, spring frame, and electric light, £78; special de Luxe 7h.p. Powerplus, with spring frame, £83; sidecars from 11 gns.—87-91, John Bright St., Birmingham. [X7053]

## Invicta.

INVICTA, 2-stroke, nearly new, pan saddle, Lucas horn and lamp; £25.—33, St. Stephen's Rd., Bow. [1502]

## Ivy.

IVY, 1915, 2 1/2 h.p., 2-speed, Lucas lamps and horn; great bargain, £25/10.—The Walsall Garage, Walsall. [X6963]

## No Imports in August.

**A**N event which cannot be passed over by the observant is the total cessation of imports of motor cycles last month. Though prohibited in March, neutral-made machines were allowed to enter this country under certain conditions up till July, but August represented the first blank month. We do not record this important fact as a result of feelings of rejoicing. We have already acknowledged that, although we British taught our American cousins in the early days what a motor cycle should be like, they in turn have shown us many desirable features of motor cycle construction. The real point is the important change wrought by the war and the necessity of keeping much needed gold in this country. When the glorious days of peace return we shall be glad to see once again the best of British motor cycles competing against the pick of the American market, but, till then, every patriotic Britisher with the interests of his country at heart agrees that imports should cease.

## Choice of Regiment.

**F**OR the benefit of those who may not have noticed the important announcement which appeared on page 188 of our issue of August 31st, we repeat that the method of obtaining motor cyclists for military service will in future be arranged by the different Commands as men are called up. This announcement was made in a letter from the War Office to the Editor of *The Motor Cycle* expressing the Army Council's appreciation of our work spread over the past two years.

In effect, this new official decision brings the motor cyclist sections into line with the Training Reserve outlined in Army Order 259 of August 1st. It is clear that in future, recruits presenting themselves for service will not have that freedom of choice of regiment which has been an appreciated privilege hitherto. On a man presenting himself for enlistment, should he be

found to be an experienced motorist, he will be allotted to *any* section which might at that time be in want of such a type of man.

Even in the past, all recruits accepted for any branch of H.M. Forces have been enlisted for "General Service," so that there was no guarantee that a man accepted for any particular section would continue with that section. In other words, the War Office may transfer men from one branch to another, as necessity arises, just as they have done in the case of motor cyclist despatch riders attached to Yeomanry regiments. These men, we hear, have had their motor cycles taken from them and have been given rifles and put into line regiments. Other despatch riders trained on motor cycles have finally been mounted on "push" cycles when the conditions of the country demanded it. Again, a certain number of men now attached to the Heavy Section Machine Gun Corps were, by War Office orders, transferred from the Motor Machine Gun Service, for which latter section they were enlisted, and, indeed, originally intended. In one of the instances named, we may state that we have come in for some unkind remarks from a few dissentients, though we are entirely unconnected with any changes which may have been made; indeed, we were obviously powerless to influence them. Naturally, transfers are not always popular, but this is no doubt realised by the War Office authorities, whose paramount object is to win the war. The Army can be likened to a great machine; if the War Office may render it more efficient by transferring a spoke (representing a batch of men) from one section to another, it is done without consulting the likes or dislikes of those who may be transferred.

The new announcement is bound to come as a disappointment to many men at present in munition factories who have hitherto been prevented by their employers from enlisting on account of the fact that they were engaged on work of national importance.

## THE PROHIBITION WORKS AT LAST.

### NO MOTOR CYCLES IMPORTED LAST MONTH.

**I**N commenting upon the lengthy interval between the coming into force "on paper" and actually of the prohibition of imported motor cycles in our issue of August 10th, we stated that "in the meanwhile it will be interesting to see which arrives first—the declaration of peace or the end of the imports of foreign-built motor cycles on which deposit was paid by March 27th." The latter has arrived first, and somewhat sooner than we expected, for the Board of Trade returns for August reveal the very interesting fact that no motor cycles were imported into this country during that month. The value of spare parts has also dropped considerably. It may be as well to remind readers that under certain conditions motor cycles intended for use with sidecarriers can still be imported, though apparently none arrived last month.

It is very gratifying to see a good increase in the export figures, the motor cycle industry thus doing its share in reducing the adverse trade balance.

#### IMPORTS.

„ tyres and parts ...	£35,395	£34,628	£25,519

#### Tremendous Petrol Increase.

The most interesting part of the Board of Trade returns, however, is that relating to petrol imports. The following figures reveal a remarkable increase over those of the previous month:

July, 1916, 11,526,600 gals. (duty paid on 10,528,695 gals.).  
Aug., 1916, 28,773,053 gals. (duty paid on 10,017,985 gals.).

Whatever this is due to, it gives us renewed hope for increased supplies in the quarter commencing November 1st.

## WARTIME ECONOMY.

### THE EFFICIENT USE OF CHEAPER FUEL.

**I**N connection with the articles on the use of cheap fuel perhaps the writer's experience will prove of service to those hesitating as to what course to adopt. My journeys, on business, cover seventy to eighty miles per week certain, with extras and also an occasional run in the country (very occasional now). This seventy miles is made up of journeys of a maximum length of about three miles and the odd journeys connected with a small factory engaged on war work.

Obviously, for odd travelling of this description pure Binks or kerosene fuel was unsuited, as having to fill the carburetter with petrol each time would be a nuisance and uneconomical. As a compromise a 50% mixture of No. 2 petrol and Binks was used, and inserted in each two gallons of petrol was a naphthalene ball, price about twelve a penny. The machine is a 1913 two-speed countershaft  $3\frac{1}{2}$  h.p. Premier, with sidecar generally attached, solo only occasionally. The carburetter is a 1913 B. and B., to which I fitted a Badcock by-pass about three months ago. Since making the alterations noted below I have covered about 700 miles; average human load, 25 stone.

The consumption works out as follows:

*Solo riding* test run, Derby to Sheffield and back. Total mileage Stewart speedometer 78, consumption  $5\frac{1}{2}$  pints=113 miles per gallon.

*Sidecar* test run, Derby to near Wolverhampton and back. Mileage 88, consumption 78 m.p.g.

The sidecar test would have been better but for the fact that heavy wind caused excessive bottom gear work. With an intermediate gear this would have been better. The sidecar is of medium weight.

The average speed of the sidecar can be kept at 25 m.p.h. indefinitely if the roads will allow, 35 m.p.h. having been attained over good surfaces.

*Solo riding* speed is also limited by road surface, 50 m.p.h. having been touched on good stretches.

The alterations to effect this are as follow:

(1.) **Carburetter.**—Fine gauze hood fitted over jet to break up spray, hot air inlet fitted, choke tube removed. Induction pipe lagged with asbestos.

(2.) **Cylinder.**— $\frac{1}{8}$  in. thick packing inserted under flange. Special radiators fitted to fins of cylinder.

I may say that with the radiators shown I can drive indefinitely on low gear without overheating, and the oil consumption is reduced by about 50%.

A. WILKINSON.

### Why Horizontal Twins Start Easily.

Not the least cause of the popularity of horizontal twins is their universal faculty of easy starting. One theory of the cause is that when a vertical engine is standing, the oil drains down from between the piston and cylinder, leaving the upper contact surfaces almost bare, and possibly creating a perfect jam of oil down towards the foot of the piston, especially when it is left low in the cylinder. Contrariwise, the horizontal twin maintains its oil film during the longest wait. It sounds plausible enough; and, true or untrue, I have never known a vertical twin or single which started so readily from cold as my 1915  $2\frac{3}{4}$  h.p. Douglas, which would always paddle off in a yard or so, provided it had been accurately oiled during its last run. On the other hand, I don't know that I shall feel absolutely sure on the matter until I have taken down a cold engine of each type after a long halt, for it takes some while to turn, pedal, or kick a really gummy vertical single free, whereas in theory the first few turns, pedallings, or kicks should splash up a fresh oil film; and, on the other hand, the oil ought in theory to drain down to the bottom of the circular cross section of a horizontal twin, which would leave threequarters of the arc fairly dry. After all, ought not any theory to take into consideration the facts that the horizontal twin is chiefly known in very small sizes, say 175 c.c. per cylinder, whereas the single is known chiefly in the 500 c.c. size; so you get your initial explosion after overcoming about a third of the resistance which a big single represents; and almost immediately after the first bang there is a sporting chance of another bang.

### The Cause of Overheating.

I hope the size eight hats will take up Mr. Stephenson's overheating suggestions (*The Motor Cycle*, August 31st, page 175), and work them out to a conclusion. Like many riders I have always been extremely puzzled by the special type of overheating which he describes, viz., when the engine quietly peters out without knocking. The stoppage is unaccompanied by any noise, is generally all but instantaneous, and has never been explained. We have all had considerable experience of it lately, as it is the worst vice of the average baby two-stroke engine. As readers will be aware, the engine will usually start off quite merrily in a minute or so; whether it repeats the performance again on the hill depends partly on the length of the hill, and partly on the length of the stoppage. The matter is thus obviously a question of temperature. I confess that a very few months ago I should have been tickled to death by Mr. Stephenson's theory of the electric current passing sparks over a cushion of very hot gas; it seems to fit the facts so admirably, and I have no alternative suggestion to offer in its place.

But I have a question to ask him. The phenomenon usually disappears with certain exchanges of plugs.

In my garage there are at present two machines, a  $2\frac{1}{2}$  h.p. two-stroke and a  $2\frac{3}{4}$  h.p. four-stroke twin, both of which were delivered with English plugs, and both of which regularly stopped, with the special symptoms described by Mr. Stephenson, whenever they were set to climb a hill leading up to my house. I tried several other makes of British plugs to no purpose, and one British maker went so far as to make a special plug for me without avail. Finally, I unearthed some rusty old Bosch plugs, and neither engine has suffered a stop of this kind since. So before I can accept the new theory, I shall want some light thrown on the question of whether the temperature of the electrodes can possibly be a dominant factor in the temperature of the cushion of gas between them. If this is so, can there be such a vast difference between the heating of electrodes of different makes in the same engine under the same circumstances as to permit or prevent the "silent discharge"?

### Appearance.

Mr. Scott has inflicted an extremely smashing castigation on Mr. Burnard, but he hardly tackles the real point in his remarks on the question of appearance. It is a commonplace that the unfamiliar usually strikes us as unpleasant; but Mr. Scott almost implies that the unfamiliar is invariably recognised as the acme of beauty when the eye gets used to it; and this is absolutely untrue. We can reconcile ourselves into tolerating most hideosities for sufficient reason; and in course of time we master the æsthetic possibilities of a novelty, and make the best of it. Thus, the early motor cars offended everybody's taste at first; then we got accustomed to the missing horse; finally, we realised that the prehistoric motor cars were hideous and improved their aspect until the modern car is really quite handsome. Now nothing can ever make the sidecar or the Scott sociable beautiful; they break every law of symmetry and balance; and the lack of balance in appearance is emphasised in the Scott by the disc wheels and other items which create a false impression of solidity, and exaggerate its intrinsic lopsidedness. Mr. Burnard does not dislike it because it is unfamiliar; in its main æsthetic outlines, it is identical with the sidecar, to which we are quite accustomed, and which we all agree is ugly from an artistic standpoint. This admitted ugliness is not only perpetuated, but emphasised in the Scott, for the skeleton details, which tone down the lopsidedness of the sidecar, are all filled in and blackened and underlined in the Scott. But on occasions we put up with what is ugly for sufficient reasons. The sidecar is ugly, because it is lopsided; the Morgan is less ugly; but we tolerate and even enthuse over sidecars and Morgans, because they have long been practicable three-wheelers. The Scott—I hope its designer will forgive me—is æsthetically even uglier than a sidecar; but if it is better (as I feel it is bound to be); it should annex a remunerative slice of the market.

"Failures" in a tangle on Blea Tarn Pass, Lake District, in the A.C.U. One Day Trial of 1912.

I HAVE already confessed to being a kind of semi-"shamateur" in a brief and early chapter of my riding experiences. I was never presented with free machines, but I often rode special trade machines on public occasions, as I fear other amateurs were also in the habit of doing. I do not know how the modern "shamateur" fares, but in those days the "shamateur's" lot was not always a happy one.

For example, in one trial, after spending a week or more getting my own mount in first-class condition, I was practically forced by my manager to transfer to his latest idea, which was adorned with a weird pulley having nicked edges. Small metal bars, secured to the top of the V belt, were supposed to register with these notches, and furnish a non-slipping drive. During the first few miles the most striking feature of this revolutionary transmission proved to be a fearsome metallic jangling; but when I reached a point ten miles from a railway station, the contraption broke, and, *en passant*, ripped a large lump out of my leg.

#### "Some" Tappet.

The same genius invented an adjustable tappet, which was excellent in theory but in practice used to adjust itself on the road until the valves could no longer seat. Prior to an all-night trial I coaxed him to remove his adjustable tappets from my engine and insert solid tappets. I fetched the machine after supper, and at midnight, thousands of miles from anywhere, the engine stopped. The mechanic had made solid tappets, left them on the bench, and sent me out with the old adjustables, of which the exhaust tappet had—according to custom—lengthened itself in riding.

I became weary of this firm after a few similar experiences, and in search of excitement transferred to another. The latter's chief merit was that they supplied you with innumerable exhaust valves gratis, whereas pure amateurs had to pay for them, and as great chunks scaled off the valve face in 100 miles, this free supply system was a real convenience. I owe them one trying experience. I had been trials riding hard in a very dry summer, and had not struck grease for months. On one long trial in new country we met some appallingly greasy roads, and I had one or two rather bad tosses in a short distance. Being of the bulldog breed, I clenched my teeth, and rode about 150 miles further. When I entered the night garage I found my frame was broken, and its lack of rigidity had been responsible for my many tumbles and bruises.

#### Tyres for Trade Riders.

After that I had perhaps the weirdest experience of my competition life. I had repented of my quasi-"shamateurism," and was riding purely on my own, but quite a fleet of trade men bestrode similar machines in a thousand-mile affair. At the start I had the laugh of them, for they were all cursing their managing director who had sent them out on what were practically track racing tyres. I, knowing the weakness of their standard covers, had fitted a gigantic Kempshall on a special rim. On the very first day my carrier broke, and cut my new Kempshall in half. So I ate humble pie, and borrowed a track racing type cover from one of the trade men. It was worn out by night, and on reaching the hotel I was admitted into

**More Sporting Reminiscences.—**

the freemasonry of the team. Underneath the rear seat of a car accompanying the trial were spare covers *ad lib.*, and the entire team were fitting new covers at least once daily. How we did it I don't know. Those were the days of the short control system, and the margin between 18 and 20 m.p.h. over ten and twenty-mile controls is not long, whilst we only had half an hour after breakfast each morning, of which at least fifteen minutes went to the usual fight for petrol cans and funnels. I know I had about three dozen punctures that week, and changed six covers, nor was I the unluckiest of the bunch.

**An Indomitable Sportsman.**

About this time much light relief was afforded in many big trials by a certain sportsman who regularly finished the day's ride at three o'clock the next morning. He was not a bad driver or mechanic by any means, but he always rode some impossible 'bus, often selecting, for example, a single-gear'd lightweight for a week of bad hills. He used to say it was easier to carry it up a precipice than to push a standard touring machine; and certainly few of us recorded clean ascents in those days. So he would usually turn up at 3 a.m. and sleep in the hotel porch till the servants woke up, when he would have a refresher or two, breakfast with us, and start out again gaily at 8 a.m. to repeat the performance next night. His record achievement was as follows: He reached the half-way house of the day's run about midnight; it was many miles from a railway station, and at the foot of the awful hill he found two dejected trade riders who were wondering how to get back to London. It was pitch dark, and they had only about a teacupful of carbide and one lamp. But he unearthed a smithy, where the trio repaired all three machines. The one decent goer was then ridden up the hill, and the other two were pushed up, the one and only lamp being taken up and down the hill for each machine. Then, with the one lighted machine leading, the dauntless trio covered many miles of highly dangerous road, and were with us in time to start punctually on the next day's run. I think it was this day's run which included a very bad corner not far from the start. Now this indomitable old sportsman's worst failing was a habit of taking corners much too fast. So some of the knowing ones waited at this corner to see him come along—not too near the danger point, or he would have smelt a rat. About half an hour after the leaders had passed, the dauntless one was seen tearing up at about 40 m.p.h. There was a cloud of dust
